Made in the USA Since 1878

Steam Traps
Condensate Pumps
Pressure Regulators
Temperature Regulators
Control Valves
Relief Valves
Liquid Drainers
Check Valves

Manufacturing High-Quality Steam & Fluid Specialty Products for Industry

Manufacturing High-Quality Steam & Fluid Specialty Products for Industry

Made in the USA Since 1878

**Steam Traps
Condensate Pumps
Pressure Regulators
Temperature Regulators
Control Valves
Relief Valves
Liquid Drainers
Check Valves**

For over 145 years, **Watson McDaniel** has been manufacturing a wide range of steam specialty and fluid products for the industrial marketplace. These time-tested products have made the operation of steam, compressed air, heat transfer and fluid systems substantially more effective and efficient.

In 1995, **Watson McDaniel** received its **ISO 9001** Quality Certification as industry recognition of our continued commitment to world class manufacturing, assembly and quality control procedures. This level of quality certification assures our customers unequalled dependability of our products. Our manufacturing facilities, with over fifty computer numerical controlled (CNC) machining centers, is considered the most modern in the industry.

Watson McDaniel serves the global marketplace with a network of Manufacturers, Representatives, Distributors, Manufacturing Plants and Sales Offices located throughout the world. In 1997, a Manufacturing Plant and Sales Office was opened in Shanghai, China to fulfill the growing demands of steam specialty products in the Far East. The success of this operation has allowed us to quickly deliver products with competitive prices to our customers throughout this region.

The structure of our operation affords us the ability to give highly personalized attention to each and every customer. We continually strive to provide ultimate customer service and product reliability while responding immediately to our customers' requests and detailed needs. Watson McDaniel welcomes the opportunity to work with your company so that we may help to make all of your steam system and fluid applications the best that they can be.

What is Steam?

Steam is simply the gas that is formed when water is heated to its boiling temperature at a given pressure.

A tea kettle is the most common example of producing steam by heating water to its boiling temperature (212°F). In this case, the steam does not develop any pressure and is released into the atmosphere. A boiler will generate steam under pressure by heating a large quantity of water in a contained system. This pressurized steam will travel throughout the pipes in the system to where it is needed. In addition to being created from water, which is readily available and relatively inexpensive, steam has many other advantages that make it easy and efficient to work with.

What makes steam desirable to use for heating?

Another benefit of using steam is that steam temperature is directly related to the pressure of the system. Therefore, by increasing or reducing pressure, it is easy to increase or reduce the temperature.

The Steam & Condensate Loop

Introduction

Pressure / Temperature Relationship of Steam

Steam is created when water is heated to its boiling temperature until enough heat energy is absorbed to transform the water from a liquid to a gas. The temperature at which water boils is 212°F; however, this is the boiling point of water at 0 psig, or atmospheric pressure. A unique property of steam is that there is a direct relationship between the pressure at which it is generated and the temperature at which it boils.

The boiling temperature increases as steam pressure increases. If steam is generated at a pressure higher than 0 psig, the temperature at which the water boils will be higher than 212°F. An abbreviated version of the Saturated Steam Table is included to show the exact boiling temperature at various steam pressures. (The complete steam table is available in Engineering Section.)

Steam Pressure (psig)		Temperature (°F)	
		Steam	Boiling Water
	0 psi =	212° F	212° F
	1 psi =	215° F	215° F
	4 psi =	224° F	224° F
	10 psi =	239° F	239° F
	50 psi =	298° F	298° F
	100 psi =	338° F	338° F
	150 psi =	366° F	366° F
	200 psi =	388° F	388° F
	300 psi =	421° F	421° F

Steam Supplies Heat at a Constant Temperature

Steam does not reduce its temperature when it releases its heat; it just simply changes from a gas back into water at the same temperature. For example, steam at 50 psig (is at 298°F; refer to steam chart above) will condense back to water at 298°F when it releases its heat energy. In contrast to steam, water reduces in temperature when it gives up its heat.

What is saturated steam?

Steam that is generated under pressure inside the boiler, while in the presence of boiling water, is referred to as **Saturated Steam**. If additional heat is later added to the saturated steam to increase its temperature, it is then referred to as Superheated Steam. Superheated steam is used in power generation and saturated steam is used for heating. When saturated steam releases its energy, it condenses back to water. This hot water at or near boiling temperature is referred to

Heating Properties: The energy absorbed by water at its boiling point to transform it from a liquid to a gas is known as **Latent Heat**. This Latent Heat is then released by the steam when used for heating. Steam is very efficient in transferring heat to other processes. Steam, being a gas, allows it to surround any surface it needs to transfer its heat energy into. When steam transfers its heat, it condenses back into water, which will be drained away and sent back to the boiler in order to be used again (referred to as Condensate Recovery).

Where else is steam used?

Hospitals and pharmaceutical manufacturers may use steam for the sterilization of medical instruments and production of medicines, while the petrochemical industry may use steam for processing gasoline from crude oil. Steam is essential in large scale food processing & manufacturing applications. Large cities, such as New York, have centralized steam systems for heating large apartment complexes.

Steam Turbines in Power Plants

Steam exhaust from power plants

Steam used in cities for heat

Typical equipment used for process heating in steam systems

A steam jacketed kettle contains a liquid to be heated surrounded by an isolated jacket containing the steam (steam does not contact the fluid). They are typically found in commercial food processing facilities. The Shell & Tube Heat Exchanger is used for continuous processes where a liquid to be heated (such as water), continually flows through the tubes surrounded by the steam.

Steam Jacketed Kettle

Shell & Tube Heat Exchanger

(Single tube shown for clarity)

Typical pieces of equipment used to control, protect and optimize steam systems

Now that a basic understanding of steam has been provided, let's introduce some components of the system and their general purposes:

Steam Traps

Since steam is created from water, it will condense back to water after releasing its energy during heating. This water, or condensate, must be removed to not only ensure proper heat transfer, but system safety as well. Removing condensate without the loss of live steam is the primary function of Steam Traps. Steam traps also discharge air that is present in the system prior to system start-up.

Pressure Regulators & Control Valves

Steam is generated at the boiler at pressures sufficient to ensure travel throughout the entire piping system. Pressure Regulating Valves and Control Valves may be used for temperature control or to reduce the steam pressure generated at the boiler down to more usable levels.

Condensate Return Pumps

When condensate does not have sufficient pressure to return to the boiler on its own, mechanical or electric pumps are required to pump the condensate back to the boiler.

Introduction

How does steam flow in a system?

Steam coming from the boiler is distributed throughout the system by pipes referred to as steam mains or steam supply lines. Since steam is generated under pressure at the boiler, it will travel on its own through the system. Steam may travel in pipes at velocities exceeding **90 mph**; for this reason, care should always be taken to open and close valves slowly.

What is condensate and why must it be removed from a system?

When steam releases its heat energy, it condenses from a gas back to a liquid. This “condensed” steam is referred to as **condensate**... which is nothing more than extremely hot water. As previously discussed, steam at 50 PSIG condenses back into water at 298°F. Steam Traps were specifically designed for the removal of unwanted **Condensate** and **Air**.

Condensate will form in steam pipelines due to radiation losses through the pipe walls. Drip Traps remove condensate from steam pipelines. However, the bulk of the condensate formed in the system occurs in the heat exchangers and other processes, and must be removed or the system would fill with water and impede the heat transfer process. In contrast to drip traps, Process Traps remove condensate from the actual process application (such as a heat exchanger).

System showing use of Steam for Heating in two different Process Applications: Steam Jacketed Kettle & Tank with Steam Coil (Vat Process)

Note the process steam traps draining condensate from the Steam Jacketed Kettle and the Vat Process, discharging into a condensate return line. Condensate is then drained into a vented receiver which is used to release flash steam from the hot condensate in order to neutralize the pressure in the condensate return line. Also note the drip traps used for draining condensate from the steam supply lines. Other components, such as control valves and pressure regulating valves that would be required to control steam pressures and product temperatures, have not been included for simplification purposes.

WHY ARE STEAM TRAPS REQUIRED?

The purpose of the steam trap is to allow Condensate (water that is formed from the condensed steam) and air, to be discharged from the steam system while preventing the loss of live steam. The steam trap is a special type of valve which opens when condensate and air are present and closes when steam tries to pass.

CONDENSATE: (condensed steam or water): Any time steam releases its heat energy (latent heat), the steam condenses back to water. This water is therefore referred to as condensate. This transformation of steam back to liquid condensate will occur in a radiator heating a room, in a heat exchanger making hot water, in a pipe transferring the steam over long distances, or in any process that uses steam. If this condensate is not continuously removed, the radiators, heat exchangers and piping will fill with condensate (water). The removal of condensate from the steam system, while preventing the loss of live steam, is therefore the primary function of the steam trap.

AIR: Before the steam is turned on and the system is cold, air will exist in all the steam pipes and process equipment, such as radiators and heat exchangers. This air must be bled from the entire system to allow the steam to enter and reach its intended designated process. The air is actually pushed thru the system by the incoming steam and automatically bled thru the process traps at the end of the steam lines or special air vents at the high points in the system. This bleeding of air from the system allows the steam to enter.

GENERAL APPLICATION CATEGORIES for STEAM TRAPS:

DRIP APPLICATIONS: Drip applications refer to removing the condensate that forms in the steam main and steam supply lines as opposed to condensate that forms at the actual process (heat exchanger, jacketed kettle, radiator, etc.). When steam loses its heat energy due to radiation losses through the pipe walls, condensate forms in the pipes. This condensate needs to be continuously removed, and it is therefore common to have steam traps placed 150–300 feet apart throughout the piping system. Traps used for this application are referred to as drip traps and have small condensate capacities as opposed to process traps. Drip traps are not normally relied upon to discharge the air from the system. Air removal is performed by the process traps and air vents located throughout the system. The most common trap choices for drip applications are the **Thermodynamic** style for line pressures over 30 PSIG, and Float & Thermostatic style for line pressures up to 30 PSIG. **Inverted Bucket (IB)** style traps are also commonly used for drip trap applications. The orifice of the IB is mounted at the top of the trap which makes them less susceptible to failure from dirt and pipe scale when compared to other trap types.

PROCESS APPLICATIONS: Process applications refer to removing condensate and air where the actual process using the steam is taking place. This process could be a heat exchanger making hot water, or a radiator heating a room, or anything else that requires the use of steam. Traps used for process applications require larger condensate handling capability in contrast to steam traps that are used for drip applications. Traps used in Process applications also need to be able to discharge large amounts of air present in the system at start-up. The most common trap choice for process applications are **Float & Thermostatic** traps since they do an excellent job of discharging condensate and air. **Thermostatic** traps make a good choice for process applications since they also do an excellent job of discharging air and condensate. In contrast, the lack of air venting capability of the Thermodynamic and Inverted Bucket traps, make these trap types a less desirable choice for most process applications.

Common Types of Steam Traps

Shown below are some of the most common types of steam traps; Float and Thermostatic, Thermodynamic, Thermostatic, as well as a Thermostatic Air vent. Other common steam trap types are the Inverted Bucket and the Bi-Metal. In the following diagrams, other system components such as control valves and regulating valves are often required to control steam pressure and process temperatures. (Some piping components may not be included in the diagrams for simplification purposes.)

Thermostatic Trap

Contains a thermostatic element which allows air and condensate to be discharged, but closes when steam is present.

Thermodynamic Trap

Contains a disc and seat arrangement which allows condensate to be discharged, but will close when steam tries to pass through.

Float & Thermostatic Trap

Contains a float-operated valve to discharge condensate, and a thermostatic air vent which discharges air, but will close when steam is present.

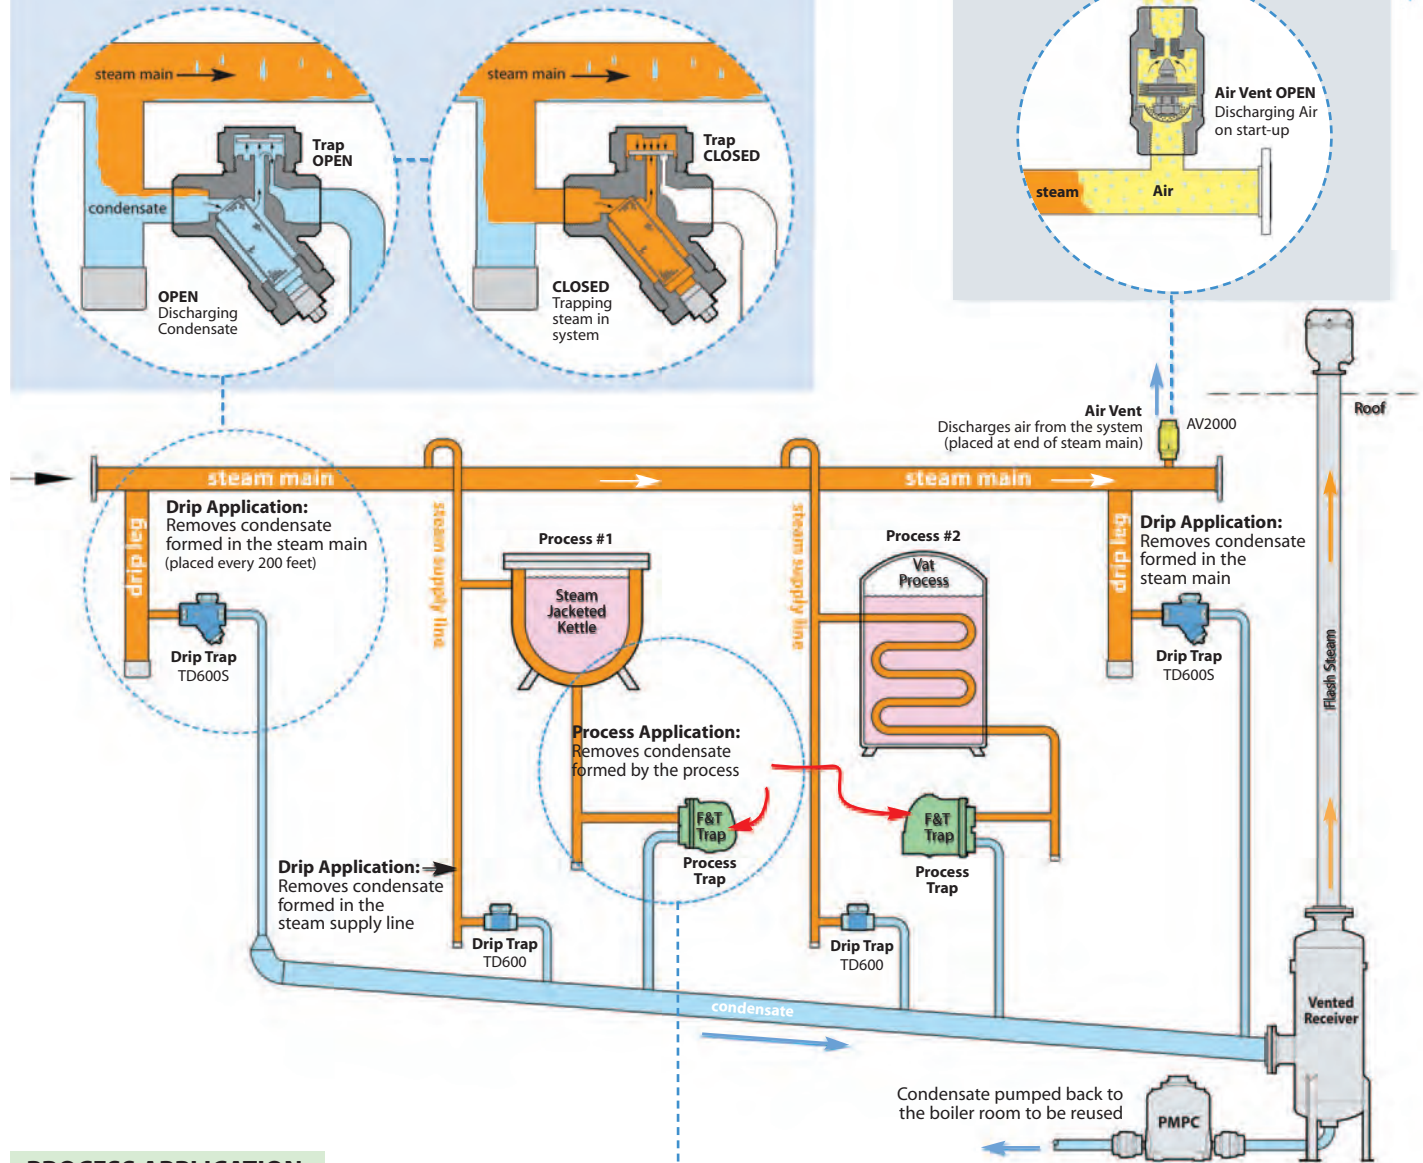

Thermostatic Air Vent

Air Vents are used in steam systems for the removal of air and other non-condensable gases. They are placed at the end of steam mains and directly on process equipment.

DRIP APPLICATION:

Drip applications refer to **removing the condensate that forms in the steam pipes** as opposed to condensate that forms at the actual process. It is appropriate to have steam traps (drip traps) placed 150 to 300 feet apart.

PROCESS APPLICATION:

Process Applications refer to **removing condensate and air from the actual process** where steam is being used. This process could be a heat exchanger making hot water, or a radiator heating a room, or anything else that requires the use of steam. Traps used for process applications require larger condensate handling capability than steam traps used for drip applications and also need to be able to discharge large amounts of air.

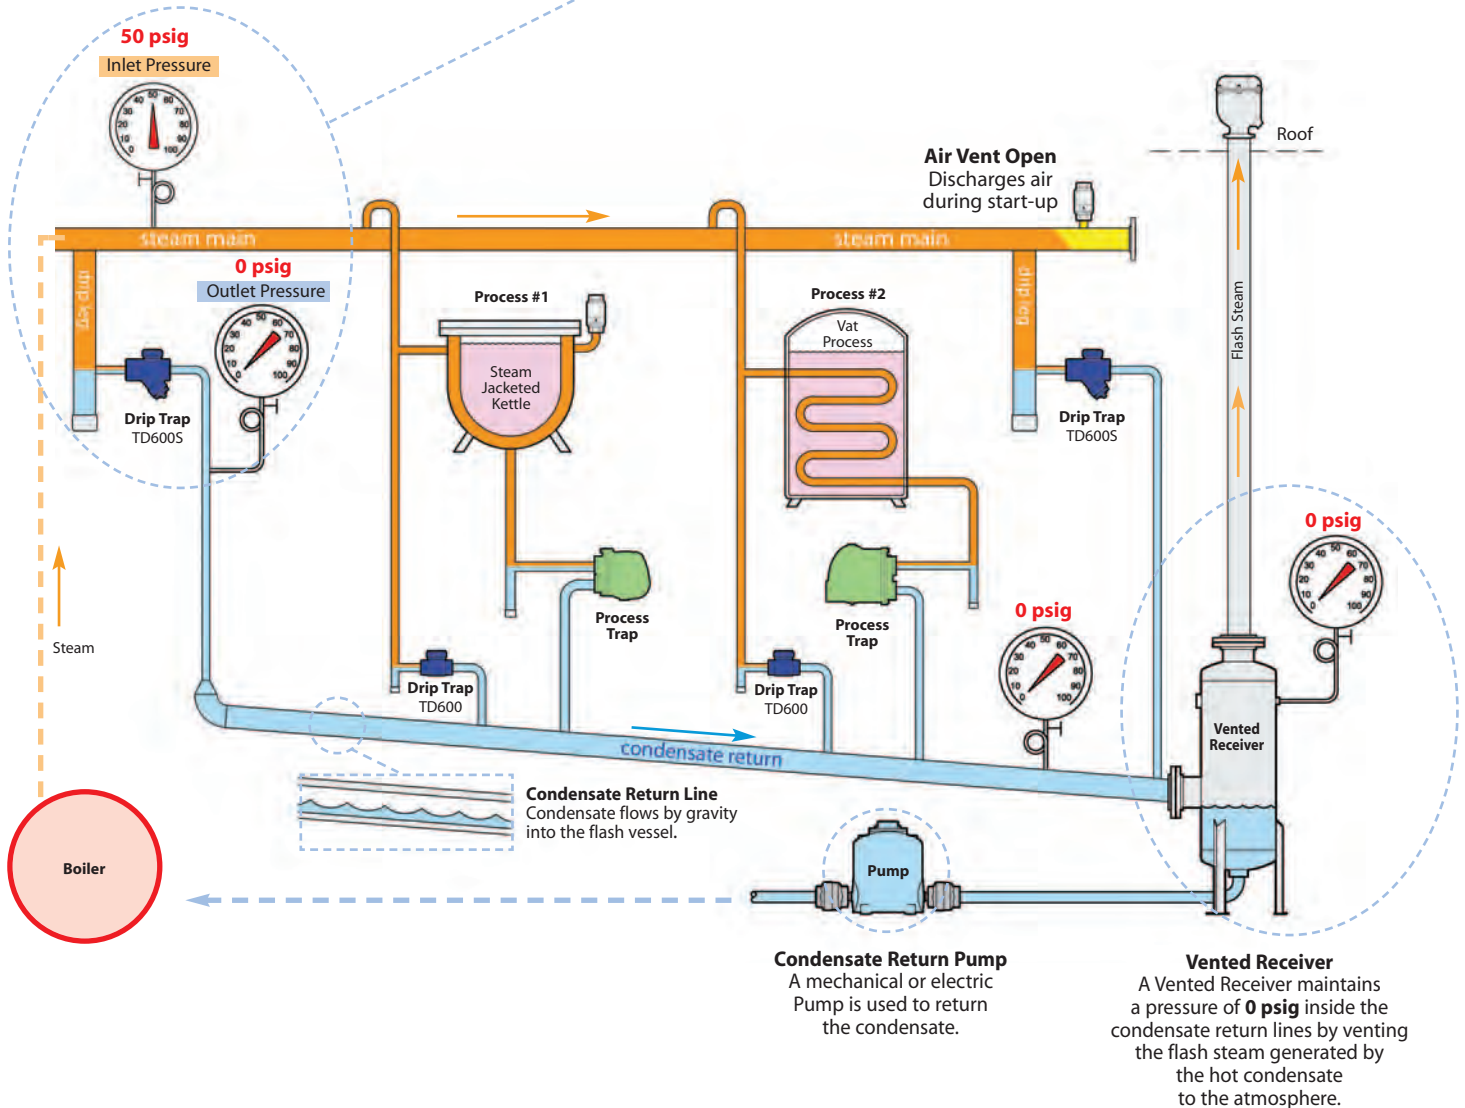

How does condensate flow through steam traps? *Steam Pressure pushes the condensate through the trap.*

Every steam trap has an **Inlet Pressure** (Steam Supply Pressure) and an **Outlet Pressure**.

The difference between inlet & outlet pressure is referred to as the **Differential Pressure**. When the Inlet Steam Pressure is higher than the Outlet Pressure (Positive Differential Pressure), the steam will "PUSH" the condensate through the steam trap.

Differential Pressure is an important factor for sizing steam traps as well as other components, such as regulators and control valves. The higher the Inlet Pressure in relation to the Outlet Pressure, the more condensate the trap can remove from the steam system. The trap capacity is therefore a function of the differential pressure across the trap.

Inlet Pressure (Steam)	–	Outlet Pressure (Condensate)	=	Differential Pressure
50 psig		0.0 psig		= 50 psi

Operation of a Steam System

DRIP APPLICATION using a Thermodynamic Trap: Removing condensate from steam mains & steam supply lines

Drip applications refer to removing the condensate that forms in the steam pipes (due to heat losses) as opposed to condensate that forms at the actual process. It is appropriate to have "Drip traps" placed 150 to 300 feet apart in the steam pipe line, and at any abrupt changes in direction or elevation. Air discharges through the separate air vent located at the end of the steam line.

The Steam Trap discharges the Condensate & the Air Vent purges the air.

PROCESS APPLICATION using a Float & Thermostatic (F&T) Trap: Removing condensate and air from a steam jacketed kettle

Start-Up – Air discharging from system

Air that entered the system during system shut-down must be purged so that steam may enter. Float & Thermostatic steam traps contain a separate thermostatic air vent for discharging air during system start-up.

Note: Additional air vents may be installed on the process or other high points in the system.

Operation – Condensate discharging from system

Steam now fills the jacket at full operating pressure, heating the contents of kettle. Steam is condensing and the steam pressure in the kettle is being relied upon to push the condensate through the steam trap and into the condensate return line.

Typical Ways Steam Traps are Installed ... and how this affects the differential pressure.

Depending on the installation of the steam trap, the pressure at the outlet of the trap can vary significantly. It is important to understand the trap Outlet Pressure as this will affect the differential pressure used for sizing and selecting the appropriate steam trap. Furthermore, there could be instances where steam supply pressure to the inlet of the trap is insufficient to "push" the condensate into the return line. The following diagrams show: **1) discharging condensate to atmosphere, 2) discharging condensate into gravity return line, and 3) discharging condensate into an elevated and/or pressurized return line.**

1) Discharging Condensate to Atmosphere:

Steam Pressure "pushes" the condensate through the steam trap allowing it to discharge out of the system (0 PSIG)

Discharging condensate to atmosphere is often done in larger facilities when it may not be cost-effective or practical to install long lengths of condensate return lines back to the boiler.

Inlet Pressure: The Pressure in the steam main. In our case, **50 psig**

Outlet Pressure: Since we are discharging steam trap to atmosphere, **0.0 psig**

Inlet Pressure (Steam)	–	Outlet Pressure (Condensate)	=	Differential Pressure
50 psig	–	0.0 psig	=	50 psi

2) Discharging Condensate to Gravity Return Line (Connected to Vented Receiver):

Steam Pressure "pushes" the condensate through the steam trap allowing it to discharge into gravity return line (0 PSIG)

It is always preferable to drain condensate in the direction of gravity to a condensate return line which leads into a vented receiver for condensate collection. In most situations the vented receiver vents to atmosphere, and is therefore at a pressure of 0.0 psig.

Inlet Pressure: The Pressure in the steam main. In our case, **50 psig**

Outlet Pressure: Since the steam trap is being discharged to a properly sized condensate return line that leads to a vented receiver, we assume **0.0 psig**

Inlet Pressure (Steam)	–	Outlet Pressure (Condensate)	=	Differential Pressure
50 psig	–	0.0 psig	=	50 psi

3) Discharging Condensate into an Elevated and/or Pressurized Return Line:

Condensate Return Lines are designed to drain by gravity at 0 psig; however, they often contain unintentional pressure from being undersized or from the discharge of failed steam traps.

Steam Pressure “pushes” the condensate up through an Elevated return line (15 PSIG)

Total Back Pressure (Outlet Pressure) is the Sum of Condensate Return Line Pressure + Equivalent Lift Height Pressure

Discharging condensate upward against gravity is the least desirable scenario; however, in certain instances, it may be the only solution possible. Since condensate must be “lifted” to an elevation, it adds additional back-pressure to the discharge (outlet) side of the trap. For this example the condensate return line pressure is **5 psig**. We first need to calculate Lift Height Pressure :

$$\begin{aligned} \text{Lift Height Pressure} &= \text{Height} \times 0.433 \\ &= 23.1 \text{ Ft.} \times 0.433 \\ &= \mathbf{10 \text{ psig}} \end{aligned}$$

Inlet Pressure: Pressure in the steam main.
= **50 psig**

Outlet Pressure: Since we are discharging steam trap to a pressurized and elevated condensate return line, we need to add condensate return line pressure (5 psig) to lift height pressure (10 psig)
= **15 psig**

Inlet Pressure (Steam)	–	Outlet Pressure (Condensate)	=	Differential Pressure
50 psig	–	15 psig	=	35 psi

Calculating Lift Pressure

A column of condensate in vertical piping results in additional pressure at the outlet of the steam trap. By knowing the height of the condensate return line, the pressure of this column can be easily calculated as follows:

$$\text{Lift pressure (psig)} = \text{Lift height (ft)} \times 0.433 \text{ (psig/ft)}$$

Weight of the water column creates pressure

$$2.31 \text{ Ft.} \times 0.433 = \mathbf{1 \text{ psig}}$$

$$11.55 \text{ Ft.} \times 0.433 = \mathbf{5 \text{ psig}}$$

$$23.1 \text{ Ft.} \times 0.433 = \mathbf{10 \text{ psig}}$$

Steam Trap Installed after a Control Valve ... which can cause wide variations of trap inlet pressures and condensate loads.

The flow rate and the steam pressure in the jacketed kettle is determined by the temperature control valve. When the process fluid in the jacketed kettle reaches the desired set temperature, the control valve reduces the flow of steam which, in turn, reduces steam pressure. The Steam pressure can drop down to 0 psig or below (to sub-atmospheric pressures) to maintain just the correct amount of steam flow to keep the kettle at the exact set temperature.

With the varying amount of steam that is sent to the process, the amount of condensate that is generated also varies. If the steam demand is high for a given period, more condensate is generated after the steam is used. When there is a low steam demand, less condensate is generated.

The appropriate steam trap selected for process applications must be able to adjust to varying condensate loads without oversizing, and have the capability to remove air from the system.

Why the Steam Trap needs to be placed a minimum distance below Jacketed Kettle

When set temperature of the process fluid is reached, the steam pressure inside the jacketed kettle may reduce to 0 PSIG or even go into Vacuum. To promote condensate drainage, the steam trap is placed a certain distance below the process equipment.

2.3 ft. will provide 1 psig of condensate head pressure. As long as the trap discharges into a gravity return line (at 0 psig), there will be 1 psi differential pressure and condensate may freely drain.

$$\text{Pressure} = \text{Column Height} \times 0.433 \frac{\text{psi}}{\text{ft}}$$

$$1 \text{ psig} = 2.31 \text{ Ft.} \times 0.433$$

Typical Process Equipment Which Use Steam for Heating

Batch Processes: Steam Jacketed Kettle

Steam jacketed kettles are used for batch processing and are typically found in commercial food processing facilities. A steam jacketed kettle contains a liquid to be heated surrounded by an isolated jacket containing the steam (steam does not contact the fluid). Steam enters the kettle and its heat is then transferred to the liquid through the jacket wall and the condensate is discharged out the bottom. Steam Pressure to the kettle is controlled by the Steam Supply (Control) Valve. The steam trap is placed a minimum distance below the kettle to promote condensate drainage when low pressure or partial vacuum exists in the jacket of the kettle (14" is equivalent to 1/2 psi of head pressure).

Continuous Process: Shell & Tube Heat Exchangers

Shell & Tube Heat Exchangers are used for continuous processes such as heating a continuous flow of water or other liquid. The Shell & Tube heat exchanger contains multiple tubes inside to optimize heat transfer to the process. In the majority of applications, the process liquid goes through the inside of the tubes and the steam surrounds the outside of the tubes and is contained within the shell area. The condensate that is formed from the condensed steam is discharged out of the bottom through a steam trap. Steam Pressure to the heat exchanger is controlled by the Steam Supply (Control) Valve. The steam trap is placed a minimum distance below the heat exchanger to promote condensate drainage when low pressure or partial vacuum exists in the shell of the heat exchanger (14" is equivalent to 1/2 psi of head pressure).

Tube Bundle of a Shell & Tube Heat Exchanger

Shell & Tube Heat Exchanger

Batch Process Application: Jacketed Kettle ... from Start-Up to Reaching Temperature Set Point

Let's take a detailed look at a **batch process** application using a control valve to heat the contents of a Jacketed Kettle to a specific temperature. Steam will enter the jacket to indirectly heat the kettle contents through a metal wall.

The condensate load and pressure drop across the steam trap varies because the control valve will open and close in response to the temperature of the contents inside of the kettle. As the valve opens and closes, the **steam pressure and steam flow in the jacket** will vary, affecting the differential pressure across the steam trap and condensate load requirements. A Float & Thermostatic steam trap is the primary choice for the majority of process applications because of its ability to quickly adjust to changing condensate loads, as well as having the capability to discharge air from the system.

DIAGRAM 1:
Start-Up (Air Vents Open)

On start-up, jacket is filled with air which must first be discharged by the Air Vents to allow steam to enter for heating. Float & Thermostatic steam traps contain a separate thermostatic vent, and can discharge large volumes of air present during system startup. Additional air vents may be installed on the kettle. The faster air is expelled, the faster steam can enter and heating can begin.

Air Discharging from Process on Start-Up
DIAGRAM 2:
Steam Enters (Trap Fully Open; Air Vents Closed)

Once the air has been discharged, steam can fill the jacket. Since the kettle is cool, the control valve will open to allow as much steam as possible to fill the jacket and begin heating the contents in the kettle. The steam trap must adjust to the high condensate load as the steam is entering and building pressure.

Temperature of Steam causes Air Vents to Close

DIAGRAM 3:

Nearing Set Temperature (Trap Partially Open)

As the temperature of the kettle contents nears set point, less steam will be required and the control valve will modulate toward a partially open position. As this happens, steam pressure decreases in the jacket and therefore the pressure differential across the steam trap will likewise decrease. The steam trap will then adjust to the lower condensate flow generated.

Process Liquid is nearing Set Temperature

DIAGRAM 4:

Temperature Set Point Achieved (Steam Flow Reduced; Since Only Required to Maintain Temperature)

Once the set temperature is achieved, a significantly less amount of steam is required to maintain the temperature of the product inside the jacketed kettle. The steam supply valve will modulate to a near shut-off condition, dropping the pressure, and the kettle may be operating in vacuum. This action will impede the discharge of condensate as the pressure in the jacket will be less than atmospheric. Therefore, a vacuum breaker is required to allow air to enter the jacket and equalize the pressure. This then allows drainage of condensate through the steam trap by gravity. If the vertical discharge leg from the jacket is 2.3 ft., this will provide 1 psi head pressure to assist with condensate drainage.

System without Vacuum Breaker

Condensate does not freely drain because of negative pressure differential (i.e. atmospheric pressure at 0 psig is higher than jacket pressure at -5 psig)

System with Vacuum Breaker

Continuous Process Application: Shell & Tube Heat Exchanger

Let's take a detailed look at a **continuous process** application using a control valve on a Heat Exchanger to heat a variable flow rate of water to a constant temperature. Cold water enters the Heat exchanger and hot water is discharged at an elevated temperature.

The condensate load and pressure drop (differential pressure) across the steam trap are not constant. Therefore, it is important to select a steam trap that can handle high condensate loads at very low pressure drops, without significantly oversizing the steam trap during normal operation.

A temperature control valve will modulate between an open and closed position to deliver the proper amount of steam to a heat exchanger to maintain the outlet water at a desired temperature. During this process, the steam pressure in the heat exchanger will vary depending on the flow rate of heated water produced. *The higher the flow rate of water – the higher the steam pressure in the heat exchanger will be. Conversely, when water flow is reduced, steam pressure is reduced.*

DIAGRAM 1:
Start-Up (Air Vents Open)

On start-up, heat exchanger is filled with air which must first be discharged by the Air Vents to allow steam to enter for heating. Float & Thermostatic steam traps contain a separate thermostatic vent, and can discharge large volumes of air present during system startup. Additional air vents may be installed on the heat exchanger. The faster air is expelled, the faster steam can enter and heating can begin.

DIAGRAM 2:
Steam Enters (Trap Fully Open; Air Vents Closed)

Since the water temperature is cold, the control valve is fully open to allow as much steam as possible to fill the heat exchanger. The steam trap must adjust to the high condensate load as the steam is entering and building pressure. This steam pressure in the shell of the heat exchanger pushes the condensate through the steam trap and into the return line.

DIAGRAM 3:

Typical Running Load

The temperature control valve will automatically adjust the flow of steam (lbs/hr) to coincide with the flow rate of heated water (GPM). The higher the flow rate, the higher the steam pressure will be. The steam pressure in the shell of the heat exchanger is indirectly determined by the amount of water flowing through the heat exchanger. The steam (lbs/hr) turns into condensate (lbs/hr) and is discharged through the steam trap.

DIAGRAM 4:

High Running Load

When a high flow rate of heated water is required, the control valve will open accordingly to allow more steam (lbs/hr) and steam pressure (psi) to enter the heat exchanger. During times of high water usage, there will also be a significant increase in the condensate load (lbs/hr), as well as higher steam pressure in the shell of the heat exchanger. This high pressure steam will push the condensate through the steam trap.

DIAGRAM 5:

Low Running Load

When the demand for hot water is low, the steam control valve will adjust accordingly, allowing just enough steam to heat the reduced flow of water. The pressure in the shell of the heat exchanger will go into vacuum, preventing discharge of condensate. Therefore, a vacuum breaker is used to allow air to enter the shell and equalize the pressure, allowing drainage of condensate through the steam trap by gravity.

System with Vacuum Breaker

System without Vacuum Breaker

Steam Trap Selection Guidelines

Steam Traps for Drip Applications: “Drip traps”

Drip applications refer to draining condensate that forms in distribution piping as steam is transported from the boiler to where it is to be used. Eliminating this condensate protects valves and piping from wiredrawing and water hammer. Because condensate loads tend to be low, steam traps with smaller orifices are typically selected for extended service life. It is reasonable to consider a single trap that can operate over a wide pressure range in order to simplify selection and reduce inventory. Other factors to consider when selecting drip traps: materials, repairability, efficiency, reliability, installation orientation, personal preference/experience, as well as the trap's ability to handle freezing climates, superheated steam, or pipe scale and debris.

Steam Traps for Tracing Applications: “Tracing Traps”

Tracing Applications refer to using steam to elevate the temperature of a product, process, or piece of equipment by using tubing or some type of jacketing device filled with steam. These applications are commonly used to promote flow of heavy fluids or prevent pipelines and equipment from freezing. The relatively small traps used for these applications are referred to as “Tracing traps”. A Non-Critical Tracing application may benefit from a thermostatic steam trap which sub-cools and backs up some condensate - an adjustable bimetal trap offers additional temperature control. Thermodynamic traps are ideal for critical tracing applications where condensate back-up is not permitted.

Steam Traps for Process Applications: “Process Traps”

Process applications refer to draining condensate from the actual process using the steam. These require steam traps with relatively high condensate capacity. In the majority of process applications, it is important to discharge air present in the system during start-up so the steam can quickly enter the system. Although separate air vents can be used for this purpose, it makes sense to select a trap which has air venting capability, in addition to discharging varying condensate loads. The trap must have enough capacity to discharge the condensate even when the differential pressure across the trap is low. These low pressure conditions commonly occur in process heating applications where control valves are used to regulate the flow of steam into the equipment. However, if the trap is significantly oversized it may cause it to wear out more quickly and allow steam to pass into the condensate return. The most common trap type for process applications is the Float & Thermostatic style.

Most Common Types of Steam Traps

Most Common Use:

Process Applications from low pressure HVAC models for residential heating to Industrial cast steel and stainless steel models for Chemical and Petro-Chemical plants up to 450 PSI. Suitable alternative for drip applications to 200 psig.

F&T (Float & Thermostatic) Traps:

Float & Thermostatic Steam Traps contain a float-operated valve to continually discharge condensate and a thermostatic air vent which discharges air. Body materials available are Cast Iron, Ductile Iron, Cast Steel, & Stainless Steel for pressures up to 450 psig. (F&T traps are referred to as mechanical traps.)

Typical Applications: F&Ts are the most commonly used trap for both batch type processes and continuous process applications with rapidly changing pressures and loads.

Advantages: F&Ts quickly respond to load and pressure changes, discharge large amounts of air present at start-up which allow steam to quickly enter the system, continuously discharge condensate as it forms and offer a wide range of capacities for any process application.

Other Factors to Consider: F&Ts narrow operating pressure ranges require more care during selection. They are not self-draining, therefore, are subject to freezing. Trap body must be installed vertically for proper operation.

Steam Trap Selection Guidelines

Most Common Use:
General service drip & tracing applications above 30 psig, as well as high-pressure drip applications with superheat.

Thermodynamic Traps:

The Thermodynamic Trap is simple and compact with a single moving part (disc) which opens to discharge condensate and closes in the presence of steam. Body materials available are Stainless and Alloy Steels for pressures up to 3,600 psig.

Typical Applications: Widely used on higher pressure drip applications and critical tracing applications (where condensate back-up is not permitted).

Advantages: Rugged design, operation is easy to check due to distinct cyclic operation, relatively small with lower capacities, single model operates over wide pressure range in contrast to mechanical traps, excellent for superheated steam, self-draining when mounted vertically to prevent freezing.

Other Factors to Consider: Limited air venting, wet climates can increase cycle rates, sensitive to excess back pressure, blast discharge may not be preferred in some systems

Most Common Use:
Industrial style Thermostatic Traps are extremely versatile. Their use can range from general service drip & tracing applications to small-to-medium process heating applications.

Thermostatic Traps:

A Thermostatic Trap contains a heavy-duty, industrial-purpose welded stainless steel thermal element designed to control condensate discharge by sensing the temperature difference between steam and cooler condensate (also bimetallic designs). Body materials available are Cast Iron, Stainless and Alloy Steels with thermal element designs available for pressures up to 650 psig and bimetal designs to 2,260 psig.

Typical Applications: Extremely versatile and energy efficient, these traps are suitable for a wide range of applications. Thermal element designs are suitable for applications ranging from general service drip and tracing applications to small-to-medium batch style processes. Bi-metal designs can be used in high pressure, superheated drip applications or in lower pressure tracing applications.

Advantages: Self-draining when mounted vertically to prevent freezing, single model operates over wide pressure range in contrast to mechanical traps, small and compact with similar capacities to larger mechanical traps (F&Ts & IBs), superior air venting capabilities, welded stainless steel thermal element and bimetal elements are extremely rugged, moderate discharge due to reduced flash steam, choose between fail-open or fail-closed bellows.

Other Factors to Consider: Some condensate back-up can be expected, thermal element design not recommended for superheated applications.

Most Common Use:
Used on drip applications where excessive dirt and debris may be of significant concern. They can serve as alternatives to F&T's in process applications where air venting is not required by the steam trap.

Inverted Bucket Traps:

The Inverted Bucket Trap uses an inverted bucket as a float device to control the opening and closing of the disc and seat to discharge condensate. Body materials available are Cast Iron and Stainless Steel for pressures up to 450 psig. (IB traps are referred to as mechanical traps.)

Typical Applications: These traps have a discharge orifice positioned at the top of the trap body which make them ideal for drip applications on systems containing excessive pipe scale and debris. They may be considered for process applications where air venting is less of a concern or handled by a separate air vent.

Advantages: Rugged and simple design, top-mounted discharge orifice less susceptible to failure from dirt and debris, service life often exceeds other style traps.

Other Factors to Consider: Limited air venting capabilities, can lose its prime causing it to fail, narrow operating pressure ranges require more care during selection, not self-draining therefore subject to freezing, single position installation, fixed orifice on bucket allows small steam leakage, physical size can be large and require additional support.

DRIP Applications • Sizing a Trap for Draining a Steam Main

Drip applications refer to the removal of condensate formed in steam lines due to the radiant heat loss of the hot steam pipes to surrounding air and are required for the protection of the steam system. (Drip Traps remove the condensate from the steam lines where the process traps remove condensate being generated by the actual process.) Drip traps should be placed 150 to 300 feet apart on straight runs of piping, before elevation changes, and before critical equipment such as Regulators and Control Valves. See description below of typical drip leg configurations.

Steam moving at high velocity can engulf a slug of condensate and propel it at extremely high speeds down the length of a pipe.

Condensate must be removed from steam lines to protect piping systems from dangerous water hammer conditions.

Why Condensate Safety Load Factors and Warm-up Loads need to be considered:

During start-up, when the piping system is cold and steam begins to flow thru the pipes, steam is condensing very quickly because of the energy required to heat all the cold surfaces. Furthermore, the steam pressure in the system which is required to push the condensate through the steam trap into the return line, is low before the system comes up to full pressure. Therefore, condensate is being generated at a maximum rate and the steam pressure used to push the condensate out of the system is at a minimum. If the traps are sized for the normal running loads and normal system pressures, then they would be undersized for the start-up condition.

In a supervised start-up, condensate drain valves located throughout the system, are manually opened to drain excessive condensate generated by the cold piping system; relying less on the steam traps. Therefore, the steam traps selected for a system with a supervised start-up can be more closely sized for the actual normal running load.

Drip Leg in a Steam Main

Drip Leg Design Criteria:

- For systems with automatic start-up, L to be 28" minimum (= 1 PSI minimum head pressure)
- Drip leg diameter should be equal to steam main diameter (up to 4" in size)

Drip Leg Before Regulator or Control Valve

Drip Legs should be installed directly ahead of regulators and control valves to minimize erosion to valve trim and flooding of valve bodies.

Steam Trap Selection Guidelines • DRIP Applications

Sizing Example: Size a drip trap for an 8" steam main with 100 psig steam pressure. Traps should be placed every 200 ft. A 2x safety factor based on Warm-Up load will be used.

- Based on Warm-Up Load Chart: **100 lbs/hr** of condensate is generated per 100 feet length of pipe.
- Warm up load for 200 ft. length is therefore, **200 lbs/hr** (2 x 100 lbs/hr)
- If a 2x safety factor based on warm-up load is used, we require a trap with a capacity of **400 lbs/hr**
- Actual running load for 100 ft. length = 41 lbs/hr
- Actual running load for 200 ft. length = **82 lbs/hr**

Trap Selection: Reference the TD600S Series Capacity Chart below based on inlet steam pressure. Enter the chart under 100 psig inlet pressure to compare the capacities of different models.

The 1/2" TD600LS will be capable of discharging 375 lbs/hr of condensate at 100 psig steam pressure. The capacity is slightly less than the load calculated based on warm-up load with 2x safety factor, however, this trap selection would be a suitable choice since its capacity is well in excess of what is actually required. These loads are indicative of drip applications and lend support as to why only reduced capacity 1/2" TD600L or 3/4" TD600L traps are required for the majority of drip applications.

Drip Applications

The trap models in the chart below are appropriately sized for drip applications for the protection of steam mains and steam supply lines. Each trap is suitable for typical warm-up loads in properly insulated mains up to a minimum of 8" when installed every 150 to 200 feet. In addition to steam main pipe size, distance between traps, insulation quality, ambient temperatures and start-up condition should be considered. Consult factory representative if additional guidance is required.

Steam Trap Selection Guidelines • DRIP Applications

Thermodynamic

The Thermodynamic Disc (TD) Steam Trap is simple and compact and one of the primary choices for drip applications over 30 psig. The TD600 Series with its integral one piece body-seat design, are the most economical and commonly used for pressures up to 600 psig. The 1/2" & 3/4" TD600L will meet the capacity needs of most drip applications ("S" models have integral strainers). The TD600 Series cannot be welded in-line. The TD700S & TD900S Series are both in-line repairable and can be welded into the pipeline.

TD600L

TD600LS

TD700S

TD900S

Fully In-line Repairable

Float & Thermostatic

The Float & Thermostatic (F&T) Steam Trap is the primary choice for process applications. However, for drip applications, they can be effectively used for pressures up to 125 psig on the WFT Series & 225 psig on the FTT Series; for higher pressures, the larger body sizes required make F&T traps a less economical and desirable solution for drip service. The 3/4" WFT-125, or 1/2" & 3/4" FTT-225 will meet the capacity needs of most drip applications. Other PMO (maximum operating pressure) ranges available. For drip applications, select a PMO that meets or exceeds the maximum pressure in the main steam distribution piping.

FTT

In-line Pipe Connection

WFT

Parallel Pipe Connection

Thermostatic

Thermostatic Steam Traps are extremely versatile and can be used on a wide variety of applications from general service drips to small-to-medium batch type processes. Using a welded stainless steel thermal elements to control condensate discharge, these traps discharge subcool condensate, making them extremely energy efficient. As a result, the condensate discharged generates less flash steam which reduces back pressure build-up in condensate return lines. A single model will operate from 0 to 650 psig which simplifies selection. The WT2001, with stainless steel body and non-repairable design, is the most commonly used. The WT3001 and WT2501 have the same internals as the WT2001, however, their 4-bolt cover allows them to be in-line repairable. The WT3001 has a stainless steel body while the WT2501 is cast iron.

The WPN Series (not shown), uses a bi-metal element suitable for pressures to 2,260 psig, and will handle superheated steam.

WT2501

Repairable
(Cast Iron)

WT2001

Non-Repairable
(Stainless Steel)

Inverted Bucket (IB)

Inverted Bucket Traps are extremely rugged and have a discharge orifice mounted at the top of the trap body, making them less susceptible to failure from dirt and debris when compared to other trap types. The IB models selected are suitable choice for most drip applications.

Stainless Steel

Cast Iron

Universal Quick-Change

The all stainless steel universal style steam traps feature a permanent installation of the universal connector with a 2-bolt mounting arrangement for the universal steam trap module, allowing the steam trap to be removed and replaced in minutes. These Quick-Change Steam Traps should be considered for all drip applications.

- Float & Thermostatic
- Thermostatic
- Inverted Bucket

Tracing Applications

Steam tracing refers to using steam to indirectly elevate the temperature of a product or process by using tubing or some type of jacketing device filled with steam. In a typical steam tracing application, stainless steel or copper tubing is filled with steam and is coiled or wrapped around the outside of a pipe or tank containing material that requires heating. The steam inside the tubing transfers its heat to the material in the pipe or tank; to stop it from freezing or to lower its viscosity to allow it to flow more easily. A steam trap is required for tracing to remove the condensate and air from the system. The most common trap choice for tracing applications is the Thermostatic type. Depending on the particular tracing application, it is often desirable to have some amount of condensate backup in the tubing.

Steam Tracing Applications:		Primary Trap Choice	Special Notes
Typical Service:	Some condensate back-up preferable	• Thermostatic	Thermostatic traps are suitable for the majority of steam tracing applications; for critical steam tracing applications, where no back-up of condensate can be tolerated, thermodynamic traps should be used.
Critical Service:	No back-up of condensate permitted	• Thermodynamic	

Heating Vertical Pipelines

Tubing can be wrapped around the piping with a steam trap installed at the low point to allow condensate to freely drain by gravity. Partial back-up of condensate using thermostatic trap.

Heating Horizontal Pipelines

Tubing should not be wrapped around horizontal pipelines or condensate will collect at low points. After shutdown, condensate retained in the system could potentially freeze. Therefore, tracing tubing should be run parallel to any piping and sloped slightly towards the steam trap to promote condensate drainage.

Bi-Metal Steam Trap with Adjustable Discharge Temperature (WT5000)

For applications where overheating of product fluids in a pipeline may be a concern, an Adjustable Bi-Metal Steam Trap, such as the WT5000 (shown), should be considered. The discharge temperature of the condensate can be manually adjusted to control the amount of condensate back-up in the tracing tubing. This technique can be used to control the temperature of the product in the pipeline.

Process Steam Trap Selection Guidelines

This guide is intended to provide the user with a "starting point" for the selection of Watson McDaniel steam traps. Steam trap selection can appear to be overwhelming given the range of applications and trap choices available. Selection criteria for a specific application may include pressure & temperature ratings, capacity, physical size & weight, and materials.

Batch Process - Steady Demand

Batch type processes typically have steady demand as a batch of products is heated to a certain temperature. They tend not to experience rapid changes in steam pressure and steam flow. Common examples of such processes are: • **Unit Heaters** • **Storage Tank Coils** • **Jacketed Vessels** • **Pipe Coils**

The primary steam trap type for process equipment is a Float & Thermostatic. The **WFT** & **FTT** Series in Cast Iron and Ductile Iron are the most cost-effective solutions to most applications. The **FTE** Series is for higher capacity applications. The **FT600/601** Series traps are available in Cast Steel or Stainless Steel which may be specified for refineries and higher pressure applications. Since rapid pressure changes do not typically occur with batch processes, Thermostatic Bellows traps can also be selected. The **WT2000**, **WT3000** & **WT4000** Series have Stainless Steel bodies and may be preferred for outdoor applications to Cast Iron F&T traps, particularly when a potential for freezing exists.

Continuous Process - Varying Demand • Heating Processes (high to ultra-high capacity)

These applications use steam to heat a continuous flowing product. The modulation of the control valve results in rapid change in steam pressure and flow. Common examples of such processes are:

• **Heat Exchangers** • **Air Handling Coils** • **Instantaneous Water Heaters**

The primary steam trap type for process equipment is a Float & Thermostatic. The **WFT** & **FTT** Series in Cast Iron and Ductile Iron are the most cost-effective solutions to most applications. The **FTE** Series is for higher capacity applications. The **FT600/601** Series traps are available in Cast or Stainless Steel which may be specified for refineries and for higher pressure applications.

Safety Load Factors (SLF's) and appropriate rules to size steam traps

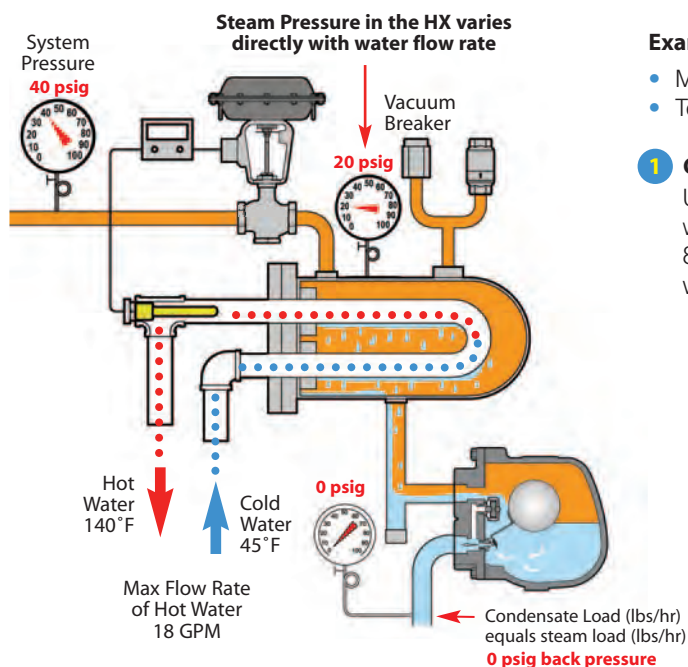

The largest condensate load occurs when the maximum steam pressure is present in the Heat Exchanger (HX). However, if the steam trap is selected based on the maximum condensate load at maximum pressure, it will not be adequately sized at lower differential pressures. This is because the capacity of a steam trap depends on the differential pressure across the trap (less pressure means less capacity) and trap capacity decreases **at a significantly faster rate** than condensate load when the steam pressure drops. When temperature control valves are used to control steam flow to a HX, the pressure may reduce to 0 psig or less. The pressure available to discharge condensate would then be based on head pressure of the drip leg. A drip leg length of 14" will produce a head pressure of ½ psig.

Use the following rules and safety factors for the three categories of process applications. This should assure the trap has adequate capacity at lower differential pressure and not be drastically oversized when operating at full pressure.

- I For applications **NOT** containing a Temperature Control Valve and operate at fairly constant steam pressures; select a steam trap that will handle **2X the maximum condensate load at the maximum differential pressure**.
For Example: if a process will generate 5,000 lbs/hr at 50 psi differential pressure, then choose a trap that can handle 10,000 lbs/hr at 50 psi.
- II For applications **WITH** a Temperature Control Valve and steam pressures **OVER 30 PSI**; select a steam trap that will handle **2.5X the maximum condensate load at the maximum differential pressure**.
For Example: if a process is expected to generate 5,000 lbs/hr at 50 psi differential pressure, then choose a trap that can handle 12,500 lbs/hr at 50 psi.
- III For applications **WITH** a Temperature Control Valve and steam pressures **UNDER 30 PSI**; calculate the maximum condensate load at the maximum differential pressure; select a steam trap that will handle this **maximum amount of condensate at ½ psi differential pressure**. *For Example:* if a process is expected to generate 5,000 lbs/hr at 15 psi differential pressure, then choose a trap that can handle 5,000 lbs/hr at ½ psi differential pressure. The purpose of the ½ psi differential pressure is that this will allow condensate to properly drain when system pressure goes into vacuum. This assumes the installation of a vacuum breaker and a drip leg of at least 14" in length (for ½ psig) below the HX to give proper condensate head pressure to the steam trap, and trap discharge to atmospheric pressure (0 psig).

PROCESS Applications • Sizing a Trap for Heat Exchanger Application

Goal: Select appropriate model and size steam trap for Process Water Heating application using a Shell & Tube Heat Exchanger in which a maximum of 18 GPM of water is being heated from 45-140°F. Steam Pressure to the control valve is 40 PSI. The trap is discharging to a condensate return line at atmospheric pressure (0 psig back pressure)

Example: Conditions of Service at Max Load

- Maximum water load to be heated = **18 GPM**
- Temperature Rise: (140°F - 45°F) = **95°F**

1 Calculate Maximum Condensate Load

Using the formula below, to approximate steam load based on water flow rate (GPM) and temperature rise, a Steam Flow of 855 lbs/hr is required; therefore, 855 lbs/hr of condensate will likewise be generated.

$$\text{Steam (lbs/hr)} = \frac{\text{GPM} \times \text{Temp. Rise (°F)}}{2}$$

$$= \frac{18 \times 95^\circ\text{F}}{2} = 855 \text{ lbs/hr}$$

Steam Flow (lbs/hr) = Condensate Load (lbs/hr)

Condensate (lbs/hr) = 855 lbs/hr

2 Determining the Differential Pressure (ΔP) Across the Trap at the Maximum Condensate Load

In order to size the steam trap, we must first know the pressure in the HX at the Max Condensate Load. This steam pressure is determined by the physical size of the HX. (note that a larger HX uses lower steam pressure while a smaller HX requires a higher steam pressure to heat the same flow of water). If the pressure of the HX is not known, assume 50% of the Pressure at the inlet of the control valve is required in the HX to heat the maximum flow of 18 GPM of water. We therefore have (40 psig x 0.5 = 20 psig) **20 psig steam pressure at 855 lbs/hr.**

3 The Condensate Load at 0 psig Steam Pressure and Conditions at other Water Flow Rates

The steam trap cannot be selected solely based the condensate load at the maximum steam pressure because it will be undersized at lower steam pressures (when there is much less force to push the condensate thru the trap). Lower steam pressures occur when less water is being heated. If the steam pressure and condensate load is known at the lowest pressure, the trap can be selected based on that operating point, and it would be adequately sized at higher pressures. In this particular application, we have a gravity return line at 0 psig back pressure.

Load Chart Based on HX Size to Heat 18 GPM of Water using 20 psig Steam Pressure

	Flow Rate Water (GPM)	Steam Flow (required) (lbs/hr)	Steam Temperature (required) in HX (°F)	Steam Pressure (required) in HX (PSIG)	Actual Pressure in the HX (PSIG)	Trap Differential Pressure (PSI)	Condensate Flow (lbs/hr)
At maximum Flow Rate of 18 GPM	18	855	259	20	20 steam	20	855
Flow Rate of Water at 0 psig Steam Pressure	12.9	614	212	0	0 steam	1/2 psi 14" drip leg	614
At Flow Rate of 10 GPM of Water	10	475	185	-6 vacuum	0 steam & air mixes together	1/2 psi 14" drip leg	475

For this size HX, when water flow rate is 12.9 GPM, the steam temperature required is 212°F, therefore, the steam pressure is 0 psig. At flow rates below 12.9 GPM, the steam pressure would need to go into vacuum or mix with air drawn in thru the vacuum breaker in order to achieve the proper temperature.

Steam Trap Selection Guidelines • PROCESS Applications

4 Using Safety Load Factors to size Steam Traps

The largest condensate load occurs when the maximum steam pressure is present in the HX. However, if the steam trap is selected based on the maximum condensate load at maximum pressure, it will not be adequately sized at lower differential pressures. This occurs because the capacity of a steam trap decreases **at a significantly faster rate** than condensate load when the steam pressure drops. When temperature control valves are used to control steam flow to a HX, the pressure may reduce to 0 psig or less. The pressure available to discharge condensate would then be based on static head pressure of the drip leg. A drip leg length of 14" will produce a static head pressure of 1/2 psig.

In this application, 614 lbs/hr of condensate is being generated at 0 psig steam pressure. See Load Chart.

The appropriate safety load factor for this application is 2.5X the maximum condensate load of 855 lbs/hr. Therefore, select a steam trap based on:
 $2.5 \times 855 = 2,138 \text{ lbs/hr}$ at a differential pressure of 20 psi

5 Selecting the Steam Trap

The steam trap should be sized for a condensate load of $2.5 \times 855 = 2,138 \text{ lbs/hr}$ at 20 psi differential pressure. The HX is assumed to have 20 psig steam pressure at the maximum water usage of 18 GPM. However, when selecting the PMO (maximum operating pressure) for the trap, assume the actual pressure could reach nearly the full line pressure of 40 psig. Therefore, select a trap with a PMO of at least 40 psig.

Referring to the WFT Capacity chart below, we must select a **WFT-075** model with a PMO of 75 psig. Enter the 20 psi column inside the **WFT-075** section and scroll down until a condensate load greater than 2,138 lbs/hr is found. The capacity of 3,850 lbs/hr is the first condensate load greater than 2,138 lbs/hr.

For this application, the **WFT-075-15-N** will be capable of discharging the calculated condensate loads of 2,138 lbs/hr at 20 psi ΔP and 614 lbs/hr at 1/2 psi ΔP .

CAPACITIES – Condensate (lbs/hr)

Up to 15 PSI

Up to 30 PSI

Up to 75 PSI

1 1/4" trap is able to handle the condensate load of 614 lbs/hr at 1/2 psi. (see Load Chart to left)

This 3/4" trap can discharge 855 lbs/hr at 20 PSI but is drastically undersized at 1/2 PSI

The actual load is only 855 lbs/hr. However, with 2.5X SLFs applied, this larger trap was selected since it has adequate capacity at lower pressures.

Jacketed Kettle

As the name implies, Jacketed Kettles have a Jacket of Steam surrounding the outside of a Kettle. They are commonly used in the food and beverage industry for indirect heating of the contents in the kettle. This application demonstrates the use of the WT3003 Thermostatic Steam trap. Along with high condensate capacity handling and superior air handling capability, this trap can also operate at higher pressures. An advantage they have over F&T traps is that a single trap model operates over the entire pressure range making them easier to apply and maintain. It is typically recommended to install a thermostatic trap approximately 2 feet from process outlet piping to accommodate some back-up of condensate due to sub-cooling.

Rotating Steam Dryer

Commonly found in the Paper Making industry, a rotating piece of equipment offers a unique challenge of removing the condensate. Steam inside a rotating drum cylinder is used to heat product such as sheets of paper over the outside surface of the drum. Since the drum is rotating, the trap must be positioned **above** the condensate collection point. The steam pressure inside the drum pushes the condensate up through the pipe to the steam trap. If steam enters the tubing, it will "Steam Lock" the trap by causing it to close which in turn causes the condensate to build up inside the rotating drum. Since the pipe line is surrounded by steam, it may take an extended length of time for the steam in the pipe to dissipate. By using the Steam Lock Release feature, a small amount of steam is continually discharged thru the seat, allowing the condensate to continually reach the steam trap. This steam lock release feature is available on ALL F&T and Thermostatic traps and should be considered on this type of application.

Multi-Bank Air Heating Coils / Air Handling Unit (AHU)

For certain Industrial Heating and Drying applications, several Air Heating coils of various sizes may be set up in series to accommodate the process. The heat load of each coil should be taken into account when sizing the steam traps. It's preferable to have a separate steam trap on each individual coil.

Steam Separator

Separators are used on steam mains and steam supply lines to remove entrained water in the steam. Steam flows through the Separator and the condensate falls by gravity to the bottom where it needs to be discharged through a steam trap. F&T traps are recommended for this application.

Storage Tank Coil

When heating Storage tanks, the heat exchanger may be placed inside the tank. This may be simpler and less expensive than using a pump to circulate the product thru an external heat exchanger. Shown is a WT4000 Series thermostatic process trap removing the condensate. If a small amount of sub-cooled condensate is backed up, it will not adversely affect the process.

Platens

Platens are extensively used in the molding industry when steam is required to heat the mold, allowing plastics and rubber to be formed into different shapes and sizes. On this particular Process application, a TD700S thermodynamic trap is being used to remove the condensate. Since Air is generally only present during system start-up, and this type of process may run non-stop for extended periods of time, a thermodynamic trap is a potential choice for this application.

Introduction

THERMODYNAMIC TRAPS

Thermodynamic traps use only one moving part, the valve disc, which allows condensate to be discharged when present and closes tightly upon the arrival of steam. These traps have an inherently rugged design and are commonly used as drip traps on steam mains and supply lines. Their solid construction and single moving part make them resistant to waterhammer and are freeze-proof when installed vertically. Thermodynamic traps will only discharge small amounts of air and therefore are typically not used in process applications. Since Thermodynamic traps rely on steam velocity to operate, they are not intended for low pressure service (below 30 PSI).

Operation:

The inlet pressure to the trap pushes the disc off the seat and allows unwanted condensate to be discharged through the peripheral outlet surrounding the inlet (**Figure A**). As hot condensate reaches the disc chamber, flash steam is created that travels at high velocity from the inlet to the outlet creating a low pressure area under the disc and higher pressure above the disc (**Figure B**). This differential pressure causes the disc to close against the seat and trap the steam in the system (**Figure C**). The steam pressure above the disc creates a force holding the disc closed. Heat transfer takes place through the cap and the steam pressure above the disc begins to reduce. When the downward force created by the steam pressure above the disc falls below the force created by the incoming condensate, the disc is pushed off its seat and the process repeats itself (**Figure A**). Cycle time is dependent on steam temperature, and more importantly, ambient temperature outside the trap. Since the amount of time the valve remains closed is primarily dependent on the heat transfer from the steam above the disc to the ambient environment, frequent cycling of the valve can occur in cold or wet environments. Applying an insulating cap over the cover of the trap will reduce the cycle rate.

A) Valve Disc (Open)

B) Valve Disc (Starting to Close)

C) Valve Disc (Closed)

- A)** When condensate is present, trap remains in the open position allowing condensate to discharge.
- B)** When steam enters the trap, it creates an internal pressure above the disc that instantly forces the disc and seat to close tightly, preventing steam from escaping.
- C)** Trap will remain closed, trapping steam in the system until the steam above the disc condenses, due to heat loss through the cap.

PMO Max. Operating Pressure	600 PSIG
TMO Max. Operating Temperature	800°F
PMA Max. Allowable Pressure	600 PSIG up to 800°F
TMA Max. Allowable Temperature	800°F @ 600 PSIG

Typical Applications

DRIP, TRACING: **TD600** model steam traps are most commonly used in drip applications, such as draining condensate from steam mains and steam supply lines. They can also be used for steam tracing applications. These traps are suitable for outdoor applications that are subject to freezing as well as superheated steam conditions. They are compact and rugged with only a single moving part. If a trap with an integral strainer is desired, the TD600S is recommended. If a fully in-line repairable design is required, the TD700S or the UTD450 with Universal Quick-Change connector is recommended.

How It Works

The disc is the only moving part inside a thermodynamic trap. When steam enters the trap, it creates an internal pressure above the disc that instantly forces the disc to close tightly on the seat, preventing the steam from escaping. The internal steam pressure (holding the disc and seat shut) eventually drops, and the trap re-opens. When condensate enters the trap, it pushes the disc upwards, allowing the condensate to freely discharge. If steam is present, the trap instantly shuts.

Features

- High pressure applications up to 600 PSIG
- Hardened stainless steel seat and disc for extended service life even at high pressure
- Single trap will operate over the entire pressure range of 3.5-600 PSIG (recommended above 30 PSIG)
- Suitable for superheated steam
- Freeze-proof when trap is piped in a vertical orientation for complete drainage of condensate
- Three-hole balanced discharge extends life of the seat area
- Trap will function in any orientation (horizontal preferred)

Sample Specification

The steam trap shall be a thermodynamic disc type with all stainless steel construction. Integral seat design and disc to be hardened for long service life. Unit shall be capable of installation in any orientation and self-draining when mounted vertically.

Installation and Maintenance

The TD600 can be installed in any orientation; however, horizontal with cap facing upward is preferred for longest service life. The one piece body-seat design is extremely simple and economical; however, this configuration is generally considered not fully repairable since the seat cannot be repaired if damaged or worn. Welding of trap body directly into pipeline is not recommended since excessive heat may cause distortion of the seat area. The TD600 does not contain an integral strainer and separate strainer should therefore be installed to protect from dirt and pipe scale. If a fully in-line repairable design or a trap that can be welded into pipeline is desired, the TD700S, TD900S or the UTD450 with Universal Quick-Change connector is recommended.

Helpful Selection Information

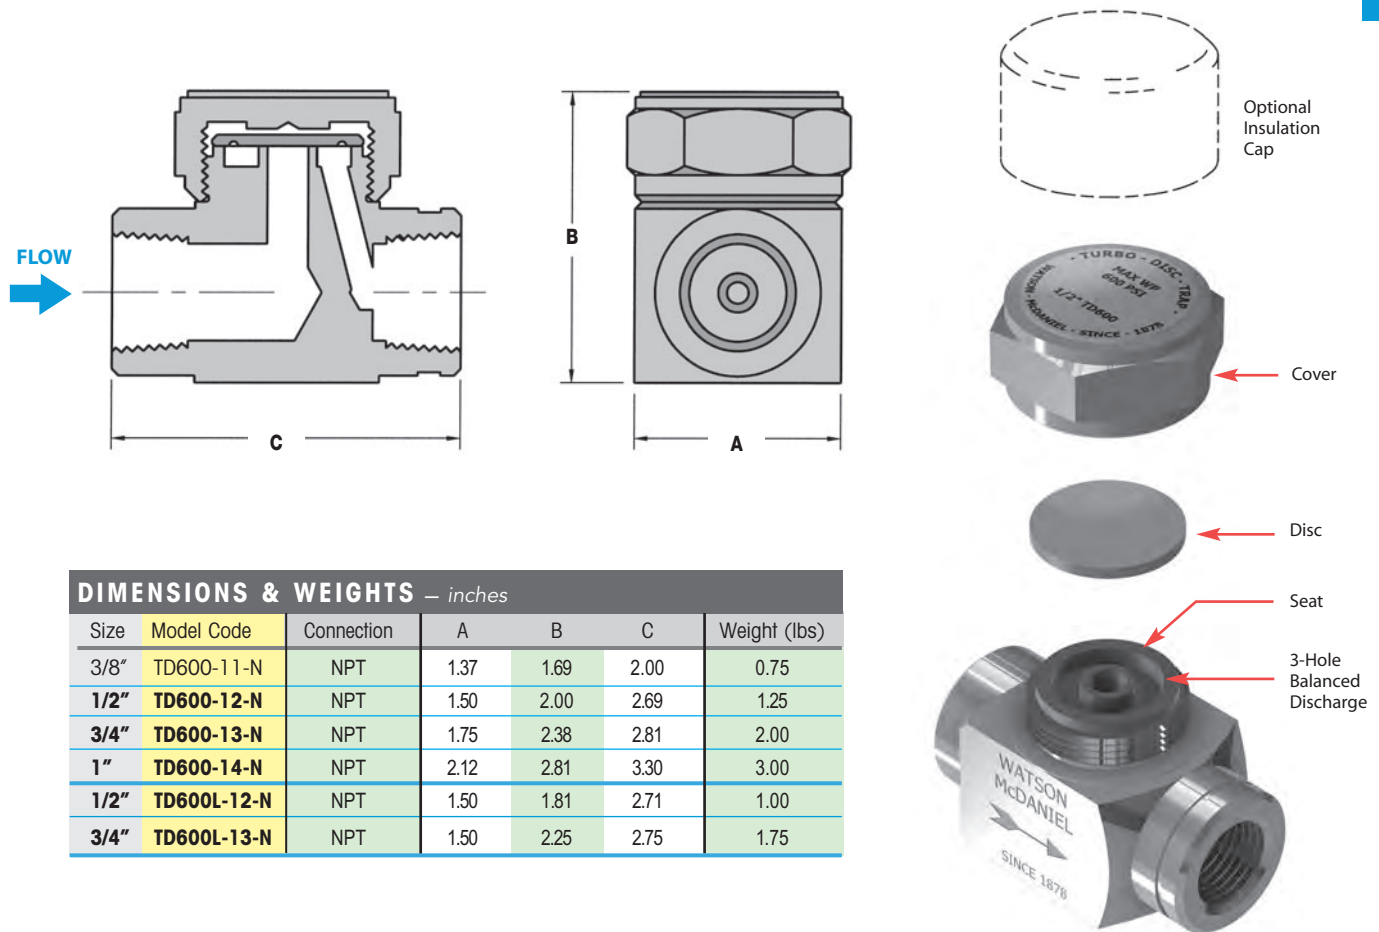

The TD600L has reduced size discharge orifice holes which are preferable in terms of performance, longevity, and efficiency; particularly on pressures over 150 psi. For most drip applications the 1/2" TD600L should have sufficient capacity. For higher load drip applications or if a 3/4" pipe connection is required, use 3/4" TD600L or best results. Choosing a model with a condensate handling capacity in the range of the specific application will prolong trap life.

L = Reduced Size Discharge Orifice holes which are preferable in terms of performance, longevity, and efficiency; particularly on pressures over 150 psi.

Options

An insulation cap is available to reduce cycle rates and steam loss in rain, snow, or cold environments.

ED = Etched disc for air service

DIMENSIONS & WEIGHTS — inches

Notes: 1) Maximum back pressure not to exceed 80% of inlet pressure (measured in absolute pressure) or trap may not close.
2) For optimum performance, recommended for operating pressure above 30 PSIG.

Steam Traps

Thermodynamic Steam Trap

TD600S
Thermodynamic

Model	TD600S, TD600LS
Sizes	1/2", 3/4", 1"
Connections	NPT
Body Material	Stainless Steel 420F
Options	Blowdown Valve, Insulation Cap
PMO Max. Operating Pressure	600 PSIG
TMO Max. Operating Temperature	750°F
PMA Max. Allowable Pressure	915 PSIG up to 250°F
TMA Max. Allowable Temperature	610°F @ 750 PSIG

Typical Applications

DRIP, TRACING: TD600S model steam traps with integral strainer are most commonly used in drip applications, such as draining condensate from steam mains and steam supply lines. They can also be used for steam tracing applications. These traps are suitable for outdoor applications that are subject to freezing as well as superheated steam conditions. They are compact and rugged with only a single moving part. Integral strainer protects against dirt and scale. If a fully in-line repairable design is required, the TD700S or the UTD450 with Universal Quick-Change Connector is recommended.

How It Works

The disc is the only moving part inside a thermodynamic trap. When steam enters the trap, it creates an internal pressure above the disc that instantly forces the disc to close tightly on the seat, preventing the steam from escaping. The internal steam pressure (holding the disc and seat shut) eventually drops, and the trap re-opens. When condensate enters the trap, it pushes the disc upwards, allowing the condensate to freely discharge. If steam is present, the trap instantly shuts.

Features

- Integral strainer with optional blowdown valve to protect trap from contamination
- High pressure applications up to 600 PSIG
- Hardened stainless steel seat and disc for extended service life even at high pressure
- Single trap will operate over the entire pressure range of 3.5-600 PSIG (recommended above 30 PSIG)
- Suitable for superheated steam
- Freeze-proof when trap is piped in a vertical orientation for complete drainage of condensate
- Three-hole balanced discharge extends life of the seat area
- Trap will function in any orientation (horizontal preferred)

Sample Specification

The steam trap shall be all stainless steel thermodynamic type with hardened integral seat and disc with integral strainer and blowdown valve.

TD600S
Strainer

TD600SB
Strainer &
Blowdown Valve

Installation and Maintenance

The TD600S can be installed in any orientation; however, horizontal with cap facing upward is preferred for longest service life. The one piece body-seat design is extremely simple and economical; however, this configuration is generally considered not fully repairable since the seat cannot be replaced if damaged or worn. Welding of trap body directly into pipeline is not recommended since excessive heat can cause distortion of the seat area. All models of the TD600S contain an integral strainer for protection against dirt and scale. If a fully in-line repairable design or a trap that can be welded into pipeline is desired, the TD700S, TD900S or the UTD450 with Universal Quick-Change connectors is recommended.

Helpful Selection Information

The TD600LS has reduced size discharge orifice holes which are preferable in terms of performance, longevity, and efficiency; particularly on pressures over 150 psi. For most drip applications the 1/2" TD600LS should have sufficient capacity. For higher load drip applications or if a 3/4" pipe connection is required, use 3/4" TD600LS for best results. Choosing a model with a condensate handling capacity in the range of the specific application will prolong trap life.

L = Reduced Size Discharge Orifice holes which are preferable in terms of performance, longevity, and efficiency; particularly on pressures over 150 psi.

Options

An insulation cap is available to reduce cycle rates and steam loss in rain, snow, or cold environments. Blowdown valve, used for flushing dirt and scale from strainer.

ED = Etched disc for air service

TD700S is a Direct Replacement for **Yarway Model 721**

TD700S Capsule is a Direct Replacement for **TLV Model P46Y**

TD700S
Strainer

TD700SB
Strainer &
Blowdown Valve

Typical Applications

DRIP, TRACING: **TD700S** model steam traps are fully in-line repairable and most commonly used in drip applications, such as draining condensate from steam mains and steam supply lines. They can also be used for steam tracing applications. These traps are suitable for outdoor applications that are subject to freezing as well as superheated steam conditions. They feature a "Quick-Replace" capsule that contains the trap's complete internal working mechanism, which is easily replaced while the trap body remains in-line. All models contain an integral strainer for protection against dirt and scale.

How It Works

The disc is the only moving part inside a thermodynamic trap. When steam enters the trap, it creates an internal pressure above the disc that instantly forces the disc to close tightly on the seat, preventing the steam from escaping. The internal steam pressure (holding the disc and seat shut) eventually drops, and the trap re-opens. When condensate enters the trap, it pushes the disc upwards, allowing the condensate to freely discharge. If steam is present, the trap instantly shuts.

Features

- "Quick-Replace" capsule design for easy in-line repair
- Integral strainer with optional blowdown valve to protect trap from contamination
- High pressure applications up to 650 PSIG
- Hardened stainless steel seat and disc for extended service life even at high pressure
- Single trap will operate over the entire pressure range 4-650 PSIG (recommended above 30 PSI)
- Suitable for superheated steam
- Freeze-proof when trap is piped in a vertical orientation for complete drainage of condensate
- Non-integral seat and chrome-moly body allow for trap to be welded in-line
- Trap will function in any orientation (horizontal preferred)

Sample Specification

The steam trap shall be a thermodynamic style in a chrome-moly alloy steel body with an integral strainer and optional blowdown valve. Unit shall have an all stainless steel in-line removable seat and disc capsule assembly. Trap shall be capable of installation in any orientation and self-draining when mounted vertically.

Installation and Maintenance

The TD700S can be installed in any orientation; however, horizontal with cap facing upward is preferred for longest service life. For maintenance, ALL internal components are easily removed and completely changed using a replacement kit. All models of the TD700S contain an integral strainer for protection against dirt and scale. Available in NPT, Socket-Weld and Flange connections.

Helpful Selection Information

The TD700HS is a high pressure version of the standard TD700S model. While both the TD700S and TD700HS will operate with pressures up to 600 PSIG, the TD700HS has a slightly smaller discharge orifice and is recommended for system pressures over 300 PSIG because of increased efficiency and performance. The TD700S is available in NPT, socket weld, and flange connections from 1/2" through 1". Replacement capsules are available, see Parts & Kits Section.

Options

Blowdown valve, used for flushing dirt and scale from strainer.

Customized Flanged Connections.
Specify size and face-to-face dimensions.

TD700HS

The **TD700HS** is the high pressure version of the TD700S.

The standard model **TD700S** will operate over the entire pressure range, however, the **TD700HS** will operate more efficiently and have a longer service life for pressures over 300 PSIG.

TD700S	Standard pressure capsule	4-300 PSIG
TD700HS	High pressure capsule	150-650 PSIG

Option: **TD700SB** = Blowdown Valve

Steam Traps

Thermodynamic Steam Trap (Repairable)

TD900S
 Thermodynamic

Model	TD900S, TD900LS
Sizes	1/2", 3/4", 1"
Connections	NPT, SW, 600# FLG
Body Material	Low Carbon Chrome-Moly
Options	Insulation Cap
PMO Max. Operating Pressure	900 PSIG
TMO Max. Operating Temperature	842°F
PMA Max. Allowable Pressure	1500 PSIG @ 100°F
TMA Max. Allowable Temperature	842°F @ 981 PSIG

Typical Applications

DRIP: TD900S model steam traps, capable of handling pressures up to 900 PSIG, are used in drip applications such as draining condensate from steam mains and steam supply lines. The complete internal working mechanism can be replaced while the trap body remains connected in-line. All models contain an integral strainer for protection against dirt and scale. These traps are suitable for outdoor applications that are subject to freezing as well as superheated steam conditions.

How It Works

The disc is the only moving part inside a thermodynamic trap. When steam enters the trap, it creates an internal pressure above the disc that instantly forces the disc to close tightly on the seat, preventing the steam from escaping. The internal steam pressure (holding the disc and seat shut) eventually drops, and the trap re-opens. When condensate enters the trap, it pushes the disc upwards, allowing the condensate to freely discharge. If steam is present, the trap instantly shuts.

Features

- "Quick-Change" seat and disc for easy in-line repair
- High pressure applications up to 900 PSIG
- Integral strainer to protect trap from contamination
- Hardened stainless steel seat and disc for extended service life even at extremely high pressures
- Single trap model will operate over the entire pressure range (20-900 PSIG)
- Suitable for superheated steam
- Freeze-proof when trap is piped in a vertical orientation for complete drainage of condensate
- Trap will function in any orientation (horizontal preferred)

Sample Specification

The steam trap shall be a thermodynamic style with body material in chrome-moly alloy steel. Available in size 1/2", 3/4" and 1" Class 600 socket weld ends or flanges. Unit shall have hardened stainless steel seat and disc with a removable stainless steel strainer.

Installation and Maintenance

The TD900S can be installed in any orientation; however, horizontal with cap facing upward is preferred for longest service life. For maintenance, ALL internal components are easily removed and completely changed using a replacement kit. All models contain an integral strainer for protection against dirt and scale. Available in NPT, Socket-Weld and Flange connections.

Helpful Selection Information

The TD900LS is a reduced capacity version of the standard TD900S model. The TD900S is available in NPT, Socket Weld, and Flange connections from 1/2" thru 1".

Options

- Customized Flanged Connections:
Specify size and face-to-face dimensions.
- Special 100 mesh strainer.

Notes: TD900S:
1) Minimum recommended working pressure: 20 PSIG.
2) Maximum back pressure not to exceed 80% of inlet pressure (measured in absolute pressure) or trap may not close.

TD900LS:
1) Minimum recommended working pressure: 150 PSIG.
2) Maximum back pressure not to exceed 50% of inlet pressure (measured in absolute pressure) or trap may not close.

Steam Traps

High-Pressure Thermodynamic Steam Trap

TD3600
Thermodynamic

Model	TD3600
Sizes	1/2", 3/4", 1"
Connections	BW, SW, 900# FLG, 1500# FLG
Body Material	Forged Alloy Steel
PMO Max. Operating Pressure	3600 PSIG
TMO Max. Operating Temperature	975 °F @ 3600 psi 1025 °F @ 2220 psi
PMA Max. Allowable Pressure	2220 PSIG @ 1025 °F 3600 PSIG @ 975 °F
TMA Max. Allowable Temperature	1025 °F @ 2220 PSIG

Note: Connections may limit Pressure & Temperature ratings.

Typical Applications

DRIP: TD3600 model steam traps are designed to handle the drainage of condensate from extremely high pressure systems, and are commonly used as drip traps on high-pressure steam mains and steam supply lines. These traps are suitable for outdoor applications that are subject to freezing as well as superheated steam conditions. The complete internal working mechanism can be completely replaced while the trap body remains in line.

How it Works

The disc is the only moving part inside a thermodynamic trap. When steam enters the trap, it creates an internal pressure above the disc that instantly forces the disc to close tightly on the seat, preventing the steam from escaping. The internal steam pressure (holding the disc and seat shut) eventually drops, and the trap re-opens. When condensate enters the trap, it pushes the disc upwards, allowing the condensate to freely discharge. If steam is present, the trap instantly shuts.

Features

- "Quick-Change" seat and disc for easy in-line repair
- High pressure applications up to 3600 PSIG
- Integral strainer to protect trap from contamination
- Hardened stainless steel seat and disc for extended service life even at extremely high pressures
- Steam trap model will operate over the entire pressure range (100-3600 PSIG)
- Suitable for superheated steam
- Freeze-proof when trap is piped in a vertical orientation for complete drainage of condensate
- Trap will function in any orientation (horizontal preferred)

Sample Specification

The steam trap shall be a thermodynamic style with body material in forged alloy steel. Available in size 1/2", 3/4" and 1" Socket Weld, Butt Weld ends or ANSI 600# & 1500# RF flanged connections. Unit shall have hardened repairable stainless steel seat and disc with a removable stainless steel sintered strainer.

Installation and Maintenance

The TD3600 can be installed in any orientation; however, with cap facing upward is preferred for longest service life. For maintenance, ALL internal components are easily removed and completely changed using a replacement kit. The TD3600 contains an integral high pressure sintered strainer for protection against dirt and scale.

Helpful Selection Information

This trap was designed for handling the drainage of condensate from EXTREMELY HIGH PRESSURE systems, with a maximum operating pressure of 3600 PSIG. The TD3600 is available in Socket Weld, Butt Weld and Flange connections from 1/2" through 1".

Options

Customized Flanged Connections:
Specify size and face-to-face dimensions.

Steam Traps Diffuser

WDF

Stainless Steel

Model	WDF1, WDF2
Size	1/2", 3/4"
Connections	NPT, SW
Body Material	Stainless Steel
Maximum Operating Pressure	WDF1 - 900 PSIG WDF2 - 450 PSIG

Typical Applications

The WDF Diffuser suppresses the high velocity discharge associated with blast-type steam traps in order to reduce noise, erosion and waterhammer. These compact units are made from Stainless Steel. Available in 1/2" and 3/4" NPT and SW connections.

The **WDF1** Diffuser can be fitted to the outlet of any steam or air trap discharging to the atmosphere. Maximum Operating Pressure is 900 PSIG.

The **WDF2** Diffuser can be fitted to the outlet of any steam or air trap discharging to a condensate return line. Maximum Operating Pressure is 450 PSIG.

How It Works

Diffusers use a specially-designed wire mesh absorption element to suppress the condensate discharge when mounted directly after the steam trap.

Features

- Designed to cushion the discharge of steam traps by suppressing the high-velocity condensate often associated with blast-type steam trap discharge
- Helps to reduce noise, erosion, and flash steam
- Connection options for discharging directly to atmosphere or piping directly to condensate return system

Sample Specification

Diffuser shall be all stainless steel with a wire mesh absorption element.

Installation

The diffuser should be installed directly after the steam trap and should be directed to a safe discharge area, away from personnel. Make certain that the diffuser size selected is the same as the discharge connection of the steam trap.

Introduction

Thermostatic Traps Steam Traps

Industrial type Thermostatic traps are used on drip, process and tracing applications, and use an extremely rugged welded stainless steel bellows. They have excellent air venting capability with a capacity and pressure range for a wide variety of applications. Physical size of a thermostatic trap is considerably smaller than F&T or IB style traps of similar capacity making installation and repair considerably easier. For Example: A Thermostatic trap weighing only 4 pounds is able to replace an F&T trap or an IB trap weighing over 40 pounds. In contrast to an F&T or an IB trap, a single model of a thermostatic trap works over the entire pressure range (from 0-650 PSIG) simplifying model selection. In addition, Thermostatic traps are self-draining eliminating issues with freezing in cold climates. With several repairable and non-repairable models available, thermostatic traps offer many advantages and should be considered.

With steam trap positioned above condensate collection point using the Steam Lock Release option (SLR)

**Outdoor Storage Tank
(Batch Process)**

THERMOSTATIC STEAM TRAPS

Operation:

The bellows type thermostatic trap contains a fluid-filled thermal element (bellows). The operation of this thermal element is governed by the volumetric thermal expansion of the fluid inside the bellows as it changes states. There is no adjustment required for this trap as the fluid inside the bellows is chosen for its quick response to the change in temperature between steam and condensate at various pressures. The operation of the bellows follows the steam saturation curve, always discharging condensate a few degrees cooler than the steam temperature.

During start-up, when the system is cold, the bellows is retracted and the valve plug is lifted off the seat allowing air and condensate to be discharged from the system. As hot steam approaches the thermal element in the trap, the fluid inside the bellows vaporizes and expands, closing the valve tightly. As long as steam is present, the valve will remain closed. Only when subcooled condensate or air is present will the valve open.

Watson McDaniel thermal element traps offer wide operating pressure ranges, rugged welded stainless steel bellows, and various orifice sizes, making them a great choice for a majority of applications.

Sub-cool:

The sub-cooling of condensate prior to discharge can have certain beneficial effects. In the majority of tracing applications, the sub-cooling of condensate is highly desirable because of the additional energy that is extracted from the Hot condensate. If the trap did not sub-cool condensate, this energy would be wasted.

In Batch style process applications such as jacketed kettles, plating tanks and heating of outdoor storage tanks, the sub-cooling of condensate is generally not a factor to consider since the amount of condensate back-up requires less than 1% of the heat transfer surface area and is therefore considered negligible. So a heat exchanger with 50 square feet of surface area requires only ½ a square foot of surface area to sub-cool the condensate. In a Continuous process application that exhibit rapid changes in steam pressures, steam traps requiring sub-cool could lead to additional condensate back up. This scenario is typical in instantaneous hot water heaters using a shell & tube heat exchanger with temperature control valves. The steam pressure in the heat exchanger can drop extremely fast when the water demand changes. In this case, additional sub-cooling of the condensate is required before it will discharge. In some cases, this may be acceptable, but in general, only F&T traps are recommended for process with rapid changes in steam pressures since they always discharge condensate immediately as it is formed. In addition, traps that sub-cool condensate have a softer discharge since less flash steam is generated in the return line.

- A) AIR** When air, which is cooler than steam, is present, the bellows is retracted and the seat is open, allowing large quantities of air to be discharged.

- B) CONDENSATE** When condensate, which is cooler than steam, is present, the bellows retracts and the seat opens, allowing condensate to be discharged.

- C) STEAM** When steam reaches the trap, the bellows expands, closing off the seat and preventing the steam from escaping.

Introduction

Non-Repairable (Seal-welded Stainless Steel Body)

The **WT1000** & **WT2000** Thermostatic Steam Traps have Stainless Steel, seal-welded bodies and are Non-repairable.

The **WT1000** is specifically intended for Drip and Tracing Applications.

The **WT2000** is substantially larger in capacity than the WT1000. It can be used for Batch Type Process Applications as well as for Drip and Tracing.

Also used as an Air Vent; Model AV2000.

Repairable (Replaceable Element and Seat)

The **WT3000** & **WT4000** Thermostatic Steam Traps have cast Stainless Steel bodies and are fully-repairable.

The **WT3000** has an identical capacity to the WT2000; commonly used for Process Applications but can also be used for drip and tracing if a repairable design is desired.

The **WT4000** has substantially higher capacity than the WT3000; used for larger Process Applications.

The **WT2500**, with a cast iron body, is an economical alternative to the WT3000 and is identical in capacity; however, its limited to 250 PSIG. It is likewise fully-repairable and can be used where cast iron is acceptable.

The **TA/TS Series** are referred to as Thermostatic Radiator Traps. They have brass bodies and are fully-repairable; predominantly used in the HVAC industry for steam traps and air vents.

The **WT1500** is ideal for sterilizers and is fully repairable.

Steam Traps

Thermostatic Steam Trap

(Non-Repairable)

WT1000

Thermostatic

Model	WT1000 (Non-Repairable)
Sizes	1/2", 3/4"
Connections	NPT
Body Material	Stainless Steel
PMO Max. Operating Pressure	300 PSIG
TMO Max. Operating Temperature	Saturated Steam Temperature
PMA Max. Allowable Pressure	1032 PSIG @ 100°F
TMA Max. Allowable Temperature	750°F @ 800 PSIG

Typical Applications

DRIP, TRACING: The **WT1000** is a low capacity thermostatic trap ideally sized for steam tracing. Thermostatic traps are small, light weight and have excellent air discharging capabilities. Discharging air at start-up allows steam to quickly enter the system. Trap body is permanently seal welded together and therefore non-repairable. Contains an extremely strong and rugged precision welded Stainless Steel thermal element. Its small discharge orifice, which makes it an optimal size trap for both drip and tracing applications, is susceptible to clogging depending on system conditions, therefore, a separate strainer should be installed.

How It Works

This thermostatic trap contains a welded stainless steel thermal element that expands when heated and contracts when cooled to 5°F below saturated steam temperature. When air or sub-cooled condensate are present, the trap is in the open discharge position. When steam reaches the trap, the element expands and closes off tightly.

Features

- Excellent at discharging air which allows steam to enter system quickly; extremely important during start-up
- Welded stainless steel thermal element resists shock from water hammer
- Freeze-proof when trap is installed in a vertical orientation allowing for complete condensate drainage
- Stainless steel Barstock body
- In the unlikely event of bellows failure; trap discharge remains open

Installation & Maintenance

Trap can be installed in any orientation. The WT1000 steam trap body is seal-welded and therefore non-repairable. If a new trap is required, remove from line and replace. This product cannot be welded in-line or failure of the thermal element due to excess heat may occur. Available in NPT threaded connections only.

Sample Specification

The steam trap shall be of thermostatic type with stainless steel body and stainless steel thermal element.

TMO Max. Operating Temperature	Saturated Steam Temperature
PMA Max. Allowable Pressure	362 PSIG @ 752 °F
TMA Max. Allowable Temperature	752°F @ 362 PSIG

Typical Applications

STERILIZERS, DRIP, TRACING: The **WT1500** is a thermostatic trap ideally sized for sterilizers, steam tracing, and drip legs. Thermostatic traps are small, lightweight and have excellent air discharging capabilities allowing it to also be used as a low-capacity air vent. Discharging air at start-up allows steam to quickly enter the system. Contains an extremely strong and rugged precision welded Stainless Steel thermal element.

How It Works

This thermostatic trap contains a welded stainless steel thermal element that expands when heated and contracts when cooled to 15°F (average) below saturated steam temperature. When air or sub-cooled condensate are present, the trap is in the open discharge position. When steam reaches the trap, the element expands and closes off tightly.

Features

- Excellent at discharging air which allows steam to enter system quickly; extremely important during start-up
- Welded stainless steel thermal element resists shock from water hammer
- Freeze-proof when trap is installed in a vertical orientation allowing for complete condensate drainage
- In the unlikely event of bellows failure, trap remains open to remove condensate for system safety
- Repairable with assembly kit

Sample Specification

The steam trap shall be of thermostatic type with stainless steel body and stainless steel thermal element.

Installation and Maintenance

Trap can be installed in any orientation. This product cannot be welded in-line or failure of the thermal element due to excess heat may occur. Internal seating surfaces and bellows may be accessed for cleaning or repair, if needed. Available in NPT threaded connections only.

TMA Max. Allowable Temperature	750°F @ 800 PSIG

Typical Applications

DRIP, TRACING, PROCESS: The **WT2000** is a general purpose medium-capacity thermostatic trap that can be used for steam tracing, as a drip trap on steam mains and steam supply lines, as well as for process applications. They are also commonly used as an Air Vent on heat exchangers or at the ends of steam mains. Thermostatic traps are small, light weight, operate over a wide pressure range, and have excellent air handling capabilities. Discharging air at start-up allows steam to quickly enter the system. All stainless steel construction and integral strainer, make the WT2000 an excellent choice for a variety of applications. Trap body is permanently seal welded together and therefore non-repairable. Contains an extremely strong and rugged precision welded Stainless Steel thermal element which is highly resistant to waterhammer.

How It Works

This thermostatic trap contains a welded stainless steel thermal element that expands when heated and contracts when cooled to 5°F below saturated steam temperature. When air or sub-cooled condensate are present, the trap is in the open discharge position. When steam reaches the trap, the element expands and closes off tightly.

Features

- Thermostatic traps are excellent at discharging air, which allows steam to enter quickly; extremely important during start-up
- Integral strainer to protect trap from contamination
- Welded stainless steel thermal element resists shock from waterhammer
- Freeze-proof when trap is installed in a vertical orientation allowing for complete condensate drainage
- Body is produced from stainless steel investment casting
- Hardened stainless steel seat for extended service life
- Will operate at steam pressures up to 650 PSIG

Sample Specification

Steam trap shall be of thermostatic type with stainless steel body, thermal element, internal screen, and hardened valve and seat.

Installation and Maintenance

Trap can be installed in any position. The WT2000 steam trap body is seal-welded and therefore non-repairable. If a new trap is required, remove from line and replace. Cannot be welded in-line or failure of the thermal element may occur. Available in NPT threaded connections only.

Helpful Selection Information

Two orifice sizes are available: The 3/16" orifice should be used on all drip and tracing applications as well as small process applications with lower condensate loads. The 5/16" orifice is available to be used on process applications if additional capacity is required.

Options

- Special Bellows Option; available upon request:
 - Fail-closed Bellows (standard bellows fails in open position)
 - 43°F Sub-cool Bellows (Note: Standard bellows are designed for approximately 5°F sub-cool temperature)
- **SLR** = Steam lock release
- Standard models contain a non-cleanable strainer screen. Also available without screen where it is desirable to flush dirt and scale thru the trap. Recommend WT2003 with larger orifice if used without strainer.

Weight: 1.5 lbs.

MATERIALS

TMO Max. Operating Temperature	Saturated Steam Temp.
PMA Max. Allowable Pressure	906 PSIG @ 100°F
TMA Max. Allowable Temperature	750°F @ 725 PSIG

Typical Applications

DRIP, TRACING, PROCESS: The **WT3000** is a general purpose medium capacity thermostatic trap that can be used for steam tracing; as a drip trap on steam mains and steam supply lines; as well as for process applications. All internal working components can be replaced while the trap body remains in-line. Thermostatic traps are small, light weight, operate over a wide pressure range, and have excellent air handling capabilities. Discharging air at start-up allows steam to quickly enter the system. All stainless steel construction and integral strainer option make the WT3000 an excellent choice for a variety of applications. Contains an extremely strong and rugged precision welded Stainless Steel thermal element which is highly resistant to waterhammer.

How It Works

This thermostatic trap contains a welded stainless steel thermal element that expands when heated and contracts when cooled to 5°F below saturated steam temperature. When air or sub-cooled condensate are present, the trap is in the open discharge position. When steam reaches the trap, the element expands and closes off tightly.

Features

- The thermal element and seat can be easily removed and replaced in minutes with the trap body still in-line
- Operates at steam pressures up to 650 PSIG
- Thermostatic traps are excellent at discharging air, which allows steam to enter quickly; extremely important during start-up
- Welded stainless steel thermal element resists shock from waterhammer
- Freeze-proof when trap is installed in a vertical orientation allowing for complete condensate drainage
- Body is produced from stainless steel investment casting
- Hardened stainless steel seat for extended service life
- Available with integral strainer and blowdown valve

Sample Specification

The steam trap shall be of a thermostatic type with stainless steel body, thermal element and internal strainer. Trap must be in-line repairable with a bolt-on type cover that is sealed with a spiral wound Stainless Steel AISI 316 gasket. Seat and valve to be hardened stainless steel.

Installation and Maintenance

Trap can be installed in any orientation. All internal working components are extremely easy to replace and can be performed while the trap body remains connected in-line. Repair kit includes ALL parts to fully rebuild the steam trap including thermal element, seat and gasket. The WT3000S model comes with an optional strainer. WT3000SB comes with optional blowdown valve for flushing dirt and scale from strainer.

Helpful Selection Information

Two orifice sizes are available: The 3/16" orifice should be used on all drip and tracing applications as well as small process applications with lower condensate loads. The 5/16" orifice is available to be used on process applications if additional capacity is required.

Options

Strainer, blowdown valve, steam lock release and special bellows available.

S = Strainer (**WT3001S**)

SB = Strainer and blowdown valve (**WT3001SB**)

SLR = Steam lock release

Special Bellows Option; available upon request:

- Fail-closed Bellows (standard bellows fails in open position)
- 43°F Sub-cool Bellows (Note: Standard bellows are designed for approximately 5°F sub-cool temperature)

How to Size / Order

Refer to the Capacity Chart to determine which model, the WT3001 or WT3003 is required to satisfy the condensate load based on steam inlet pressure.

Example:

Application: 3754 lbs/hr at 100 PSIG steam inlet pressure
Size/Model: **WT3003S**, 5/16" orifice with strainer,
Specify size & connections (NPT, SW, FLG)

Example Model Codes:

WT3003S-13-N 3/4" NPT with strainer, and 5/16" orifice.

WT3001SB-12-N 1/2" NPT with strainer and blowdown valve, 3/16" orifice

*For custom sizes consult factory (9\" minimum).

NPT Weight: 5.0 lbs.

Size/Connection*	Model Code	Orifice Size Description
1/2" NPT	WT3001-12-N	3/16" No Strainer
3/4" NPT	WT3001-13-N	3/16" No Strainer
1/2" NPT	WT3001S-12-N	3/16" Strainer
3/4" NPT	WT3001S-13-N	3/16" Strainer
1" NPT	WT3001S-14-N	3/16" Strainer
1/2" NPT	WT3001SB-12-N	3/16" Strainer & Blowdown
3/4" NPT	WT3001SB-13-N	3/16" Strainer & Blowdown
1" NPT	WT3001SB-14-N	3/16" Strainer & Blowdown
1/2" NPT	WT3003-12-N	5/16" No Strainer
3/4" NPT	WT3003-13-N	5/16" No Strainer
1/2" NPT	WT3003S-12-N	5/16" Strainer
3/4" NPT	WT3003S-13-N	5/16" Strainer
1" NPT	WT3003S-14-N	5/16" Strainer
1/2" NPT	WT3003SB-12-N	5/16" Strainer & Blowdown
3/4" NPT	WT3003SB-13-N	5/16" Strainer & Blowdown
1" NPT	WT3003SB-14-N	5/16" Strainer & Blowdown

* For Socket Weld Connection change **N** to **SW**
 Note: WT300R available; same options as above

Steam Traps

Thermostatic Steam Trap

(Repairable)

WT4000
Thermostatic

Model	WT4000 (Repairable)
Sizes	3/4", 1"
Connections	NPT, SW, FLG
Body Material	Stainless Steel
Options	Strainer, Blowdown Valve
PMO Max. Operating Pressure	300 PSIG
TMO Max. Operating Temperature	Saturated Steam Temperature
PMA Max. Allowable Pressure	906 PSIG @ 100°F
TMA Max. Allowable Temperature	750°F @ 725 PSIG

Typical Applications

PROCESS: The **WT4000** is a high capacity version of the WT3000, for removing condensate and air from larger process applications. This steam trap is fully repairable while the body remains in-line. Like all thermostatic traps, they are small, light weight, operate over a wide pressure range, and have excellent air handling capabilities. Discharging air at start-up allows steam to quickly enter the system. All stainless steel construction and integral strainer option make the WT4000 an excellent choice for most process applications. Contains an extremely strong and rugged precision welded Stainless Steel thermal element which is highly resistant to waterhammer.

How It Works

This thermostatic trap contains a welded stainless steel thermal element that expands when heated and contracts when cooled to 5°F below saturated steam temperature. When air or sub-cooled condensate are present, the trap is in the open discharge position. When steam reaches the trap, the element expands and closes off tightly.

Features

- The thermal element and seat can be easily removed and replaced in minutes with the trap body still in-line
- Operates at steam pressures up to 300 PSIG
- Thermostatic traps are excellent at discharging air, which allows steam to enter quickly; extremely important during start-up
- Welded stainless steel thermal element resists shock from waterhammer
- Freeze-proof when the trap is installed in a vertical orientation allowing for complete condensate drainage
- Body is produced from stainless steel investment casting
- Hardened stainless steel seat for extended service life
- Available with integral strainer and blowdown valve

Sample Specification

The steam trap shall be of thermostatic type with stainless steel body, thermal element, and internal strainer. Trap must be in-line repairable with a bolt-on type cover that is sealed with a spiral wound Stainless Steel AISI 316 gasket. Seat and valve to be hardened stainless steel.

Installation and Maintenance

Trap can be installed in any orientation. All internal working components are extremely easy to replace and can be performed while the trap body remains connected in-line. Repair kit includes ALL parts to fully rebuild the steam trap including thermal element, seat and gasket. The WT4000 does not contain a strainer. The WT4000S contains a strainer. WT4000SB contains a blowdown valve for flushing dirt and scale from strainer.

Helpful Selection Information

Two orifice sizes are available: 7/16" standard capacity and 5/16" reduced capacity. Select these models for steam systems with maximum working pressure of 300 PSIG.

Options

Strainer, blowdown valve, and steam lock release.

S = Strainer (**WT4001S**)

SB = Strainer and blowdown valve (**WT4001SB**)

SLR = Steam lock release

Customized flanged connections: Specify size, face-to-face dimensions.

How to Size / Order

Refer to the Capacity Chart to determine which model, the WT4001 or WT4003 is required to satisfy the condensate load based on steam inlet pressure.

Example:

Application: 5610 lbs/hr at 100 PSIG steam inlet pressure

Size/Model: **WT4001S**, 5/16" orifice, and strainer
Specify size & connections (NPT, SW, FLG)

Example Model Codes:

WT4001S-13-N 3/4" NPT with strainer, and 5/16" orifice

WT4003SB-14-N 1" NPT with strainer and blowdown valve, 7/16" orifice

TA Type • Right-Angle Connection

TS Type • Straight-thru Connection

Typical Applications

TA & TS type steam traps are predominantly used in the HVAC industry. They are referred to as radiator traps because the quick-disconnect right angle connection of the TA Type is found on most steam radiator installations. The TS Type offers a straight-through connection alternative. TA and TS Series radiator traps were designed specifically for removing condensate and air from 2-pipe steam heating systems. Their excellent air-handling capabilities, compact size, and economical cost make them a great choice for air vents on heat exchangers or for steam trap applications on OEM equipment. Contains an extremely strong and rugged precision-welded Stainless Steel thermal element which is highly resistant to waterhammer.

How It Works

This thermostatic trap contains a welded stainless steel thermal element that expands when heated and contracts when cooled. When air and condensate are present the trap is in the open discharge position. When steam reaches the trap the element expands and closes off tightly.

Features

- Excellent air handling capability
- In-line repairable
- Welded stainless steel thermal element
- Stainless seat on TA125, TAHC125 & TS125
- High thermal efficiency
- TAHC125 is a high-capacity version

Sample Specification

The steam trap shall be of thermostatic type with brass or bronze body and stainless steel thermal element. Trap must be in-line repairable.

Installation and Maintenance

Trap can be installed in any orientation. The bodies are made from a high-quality brass forging and are easily repairable while the steam trap remains in-line by removing the cap and replacing the seat and thermal element. Repair kit includes thermal element, seat and gasket.

TMO Max. Operating Temperature	406°F
PMA Max. Allowable Pressure	250 PSIG up to 450°F
TMA Max. Allowable Temperature	450°F @ 250 PSIG

Typical Applications

DRIP, TRACING, PROCESS: The **WT2500** is a general purpose medium capacity thermostatic trap that can be used for steam tracing; as a drip trap on steam mains and steam supply lines; as well as for process applications. All internal working components can be replaced while the trap body remains in-line. Like all thermostatic traps, they are small, light weight, operate over a wide pressure range, and have excellent air handling capabilities. Discharging air at start-up allows steam to quickly enter the system. The WT2500 is an excellent choice for a variety of applications. Contains an extremely strong and rugged precision welded Stainless Steel thermal element which is highly resistant to waterhammer.

How It Works

The thermostatic trap contains a welded stainless steel thermal element that expands when heated and contracts when cooled. When air and condensate are present, the trap is in the open discharge position. When steam reaches the trap, the element expands and closes off tightly.

Features

- The thermal element and seat can be easily removed and replaced in minutes with the trap body still in-line
- Operates at steam pressures up to 250 PSIG
- Thermostatic traps have excellent air handling capability
- Welded stainless steel thermal element resists shock from water hammer
- Freeze-proof when trap is installed in a vertical orientation allowing for complete condensate drainage
- Hardened stainless steel seat for extended service life

Thermal Element	Stainless Steel, AISI 302
Valve & Seat	Stainless Steel, AISI 416
Cover Gasket	Garlock

CAPACITIES — condensate (lbs/hr)

Size	Model Code	Orifice Size	Steam Inlet Pressure (PSIG)								
			5	10	20	50	100	125	150	200	250
1/2"	WT2501-12-N	3/16"	441	625	882	1391	1827	1969	2095	2305	2483
3/4"	WT2501-13-N										
1/2"	WT2503-12-N	5/16"	903	1271	1811	2861	3754	4043	4300	4730	5093
3/4"	WT2503-13-N										

Sample Specification

The steam trap shall be of a thermostatic type with cast iron body and stainless steel thermal element. Trap must be in-line repairable with a bolt-on type cover that is sealed with a spiral wound Stainless Steel AISI 316 gasket. Valve and seat to be hardened stainless steel.

Installation and Maintenance

Trap can be installed in any orientation. All internal working components are extremely easy to replace and can be performed while the trap body remains in line by removing the four-bolt cover. Repair kit includes ALL parts to fully rebuild the steam trap including thermal element, seat and gasket.

Helpful Selection Information

Two orifice sizes are available: The 3/16" orifice should be used on all drip and tracing applications as well as small process applications with lower condensate loads. The 5/16" orifice is available to be used on process applications if additional capacity is required.

Options

SLR = Steam lock release

How to Size / Order

Select working pressure; follow column down to correct capacity (lbs/hr). Example:

Application: 1827 lbs/hr at 100 PSIG working inlet pressure

Size/Model: **WT2501-12-N**, 1/2" NPT, 3/16" orifice.

Bi-Metallic					
Model	Body Material	PMO (PSIG)	Sizes	Connections	Page No.

Steam Traps

Bi-Metallic • Adjustable Discharge Temperature

WT5000

Bi-Metallic

Model	WT5000 (Bi-Metallic)
Sizes	3/8", 1/2", 3/4, 1"
Connections	NPT, SW
Body Material	Stainless Steel
PMO Max. Operating Pressure	650 PSIG
TMO Max. Operating Temperature	662°F
PMA Max. Allowable Pressure	900 PSIG
TMA Max. Allowable Temperature	800°F

Typical Applications

TRACING: The **WT5000** is specifically designed for steam tracing applications where accurate and adjustable control of condensate discharge temperature is desired. Can be used where a temperature sensitive medium is being transferred in piping system or held in a storage vessel and standard steam tracing methods may not be adequate to maintain specific product temperatures. Having the ability to adjust the condensate discharge temperature would allow for accurate temperature control of the product being traced. The significant feature of the WT5000 is that the condensate discharge temperature is easily field-adjustable.

How It Works

Bi-metallic plates of dissimilar metals which are connected to the valve seat assembly respond to temperature variations. At relatively cool conditions, the trap is open for the discharge of condensate. When the temperature of the condensate is equal to or higher than the set temperature, the metals react and expand, closing the trap. External field-adjustability of the bi-metallic element allows control of the condensate discharge temperature.

The condensate temperature can be field adjusted as follows:

To **INCREASE** the temperature, turn the adjuster screw:
→ **COUNTERCLOCKWISE**

To **DECREASE** the temperature, turn the adjuster screw:
→ **CLOCKWISE**

Note: The lower the set temperature, the more condensate will back-up in front of the trap inlet connection. Therefore, consideration should be given to providing adequate piping to accommodate any such back-up.

Features

- Excellent for various steam tracing and small process applications using the additional energy (sensible heat) of the hot condensate
- Field-adjustable bi-metal element allows control of condensate discharge temperature
- Internal screen and seat/plug design help prevent pipe scale and debris from accumulating on seating surfaces to provide trouble-free operation
- In-line repairable

Sample Specification

The steam trap shall be a bi-metallic type with stainless steel body, seat, valve plug and bi-metallic element. Bi-metallic element shall be externally adjustable for control of condensate discharge temperature. Trap must be in-line repairable with a replaceable bimetal element, valve plug and seat.

Installation and Maintenance

Trap can be installed in any orientation. The body is made from stainless steel and is fully repairable while the steam trap remains in-line. If the trap fails, remove the cover and replace the internal working components. Repair kit includes bi-metallic element (including valve stem and plug), seat and gasket.

Helpful Selection Information

Available in 3/8" through 1" NPT and socket weld connections. Select this model for steam systems with maximum working pressure of 650 PSIG.

Size/Connection	Model Code	Weight lbs	Cross Reference TLV
3/8" NPT	WT5000-11-N	3.0	LEX3N-TZ

Valve Seat	420 Stainless Steel
Valve Stem	420 Stainless Steel

Notes:

- 1) Capacities in chart are based on discharging condensate to atmospheric pressure (0 PSIG).
- 2) **Initial Opening Temperature = T** is the temperature at which the trap just begins to open. A negligible amount of condensate flow takes place at this temperature. It is adjustable between 120°F and 390°F.
- 3) **Initial Opening Temperature** must be at least 27 degrees below the saturated steam temperature to prevent possible steam loss.
- 4) When the condensate cools below the initial opening temperature, the Bi-metallic mechanism opens further, increasing trap capacity. Trap capacity can be adjusted up to the max value given in the chart.
- 5) For instructions on setting the trap discharge temperature and capacity, refer to the Watson McDaniel Installation and Maintenance Guide.
- 6) **Example:** A WT5000 trap with 125 PSIG Steam Inlet Pressure can be set to an Initial Opening Temperature between 120°F and 326°F. It can pass up to 413 lbs/hr when the temperature of the condensate is 80°F below the initial opening temperature (T-80°F).

T = Initial Opening Temperature of the Trap can be set from 120°F to 390°F

Steam Traps

Bi-Metallic Steam Trap

BM300 Series
Bi-Metallic

Model	BM300 (Repairable)
Sizes	1/2", 3/4", 1"
Connections	NPT, Socket Weld, Butt Weld, Flanged
Body Material	Forged Carbon Steel
PMO Max. Operating Pressure	320 PSIG
TMO Max. Operating Temperature	750°F
Max. Differential Pressure	320 PSI
PMA Max. Allowable Pressure	740 PSIG @ 100°F
TMA Max. Allowable Temperature	750°F @ 505 PSIG

Typical Applications

DRIP, TRACING: The **BM300** is a Medium Capacity Bi-metallic steam trap which is ideal as a drip trap on superheated steam mains and steam supply lines, as well as saturated steam lines and steam tracing applications. Bi-metallic traps subcool condensate before opening, making them extremely energy efficient and highly resistant to steam loss. The Body is made from Forged Carbon Steel and trap internals are fully repairable while the trap body remains in-line.

Thermostatic traps are small, lightweight and have excellent air discharging capabilities allowing it to also be used as a low-capacity air vent. Discharging air at start-up allows steam to quickly enter the system. Contains an extremely strong and robust bimetal element which is highly resistant to waterhammer. The hardened plug is back-seated to function as an internal check valve. Standard subcool is 25°F but is also field-adjustable.

How It Works

This thermostatically-actuated trap contains a bi-metallic thermal element that expands when heated and contracts when cooled to 25°F (average) below saturated steam temperature. When air or sub-cooled condensate are present, the trap is in the open discharge position. When steam reaches the trap, the element expands and closes off tightly.

Features

- The bi-metallic element and seat can be easily removed and replaced in minutes with the trap body still in-line
- Excellent at discharging air, which allows steam to enter quickly; extremely important during start-up
- Rugged stainless steel bi-metal element resists shock from waterhammer
- Freeze-proof when trap is installed in a vertical orientation allowing for complete condensate drainage
- Hardened stainless steel seat for extended service life
- Includes integral strainer with optional blowdown valve
Standard factory-set subcool is 25°F but is also field-adjustable for optimum performance and energy savings

Sample Specification

The steam trap shall be of thermostatic bi-metal type with forged carbon steel body, stainless steel thermal element, and integral strainer. Trap must be in-line repairable with a bolt-on cover. Seat and valve to be hardened stainless steel.

Installation and Maintenance

Trap can be installed in any orientation. Internal seating surfaces and bi-metal may be accessed for cleaning or repair, if needed, while the product remains in-line. Repair is done by removing the cover and replacing the thermal controller assembly.

Steam Traps

Bi-Metallic Steam Trap

WPN Series

Bi-Metallic

Typical Applications

DRIP, TRACING: WPN Series Bi-metallic steam traps are used in steam tracing, steam main drips and non-critical process equipment. They are extremely robust and reliable, making them a suitable choice for high pressure applications as well as outdoor applications that are subject to freezing. They are used in systems where a quick discharge of air, non-condensable gases and large quantities of cold water need to be drained at start-up.

Butt-weld Version (shown)

How It Works

When the system is cold, the trap is wide open discharging air and cold condensate. When the bi-metallic plates inside the trap heat up, they pull the seat closed and the flow becomes restricted. Prior to steam temperature being reached, the trap shuts off tightly. Cooler temperatures cause the seat to open further. Therefore, trap capacity will increase when colder condensate is in contact with the Bi-metal element. Trap capacity is therefore given at different temperatures below saturated steam temperature.

DIMENSIONS & WEIGHTS — inches

How to select a A WPN Trap:

- 1) Select a Pressure Controller that has a max differential pressure within the range of your application.
- 2) Select a Trap Body depending on System Pressure; WPN63 thru WPN250.
- 3) Select Connection Type & Size
- 4) Configure Model Code (see Examples below)

Example Model Codes:

WPN63-C-R56-14-F600

(Model WPN63, 810 PSI Max Differential Pressure, 1" 600# Flanged with Standard Internal Strainer)

FTE & FTES 	Extremely High-Capacity	FTE: Ductile Iron FTES: Cast Steel	High Capacity Process Applications
FT600 & FT601 	Cast Steel Body	FT600: Carbon Steel FT601: Stainless Steel	Where Carbon Steel or Stainless Steel bodies are required
FT 	Parallel Pipe Connection (H-pattern)	FT: Cast Iron	General Purpose, Low to Medium Capacity Process Applications up to 75 PSIG. Smaller sizes can also be used for Drip Applications.

FLOAT & THERMOSTATIC TRAPS

F&T steam traps are the most common trap type used for process applications. They use a float-operated valve mechanism to discharge condensate as it is formed, and an air vent for discharging air at start-up; both very important requirements for process applications.

The **WFT** and **FTT-Series** with **Iron bodies**, are suitable for most general purpose process applications up to **250 PSIG**. The 3/4" WFT and FTT are often used for drip applications.

The **FTE-Series** has **extremely high capacity**.

The **FT600 Series** available with **Cast Steel** or **Stainless Steel bodies**; often required in Chemical and Petrochemical refineries and other industries.

Float & Thermostatic Steam Traps (F&Ts) are very versatile due to their ability to drain condensate from a wide variety of applications.

They can be installed in steam distribution piping to remove condensate and protect equipment leading up to any steam-using equipment such as heat exchangers, air coils, unit heaters, radiators, etc. When installed BEFORE steam-using equipment, this is referred to as a DRIP application. Typically a small (1/2" – 1") float and thermostatic steam trap can be installed in an appropriate drip leg to drain condensate to improve steam quality and reduce waterhammer before it enters the equipment. The thermostatic element will improve start-up times by discharging air that will initially be in cold steam piping. Steam pressure and condensate loads will be relatively constant in Drip applications meaning the trap will not have to cycle much. Additional consideration may be given to higher condensate loads at system start-up until the steam system reaches working pressure and temperature.

When an F&T trap is installed directly AFTER any steam-using equipment such as at the condensate outlet of a steam-to-water heat exchanger, this is referred to as a PROCESS application. Effectively, any equipment that is using steam for heating water or other liquid, air, or an industrial material is referred to as a process. Unlike the Drip application described above, pressure and condensate load in Process applications is typically not constant and may vary significantly. The Float & Thermostatic steam trap's ability to quickly adjust and modulate to varying conditions make it the primary choice for Process applications. The float-operated valve design allows the F&T to open immediately when condensate load or pressure increases and will close quickly when condensate load is reduced. The thermostatic element improves energy efficiency by discharging air immediately at start-up to significantly reduce heat-up times.

Steam Lock Release – All efforts should be made to drain condensate from piping and equipment by gravity whereby the steam trap is located below the equipment being drained. This is referred to as Gravity Drainage. However, certain applications require the steam trap to be installed above the point where condensate collects. This type of application is referred to as Syphon Drainage and requires the steam trap to be fitted with Steam Lock Release (SLR) to consistently drain condensate for optimum heating.

One such example of an application requiring Syphon Drainage and a steam trap fitted with SLR is a Rotating Steam Dryer

Rotating Steam Dryer

Commonly found in the Paper Making industry, a rotating piece of equipment offers a unique challenge of removing the condensate. Steam inside a rotating drum cylinder is used to heat product such as sheets of paper over the outside surface of the drum. Since the drum is rotating, the trap must be positioned **above** the condensate collection point. The steam pressure inside the drum pushes the condensate up through the pipe to the steam trap. If steam enters the tubing, it will "Steam Lock" the trap by causing it to close which in turn causes the condensate to build up inside the rotating drum. Since the pipe line is surrounded by steam, it may take an extended length of time for the steam in the pipe to dissipate. By using the Steam Lock Release feature, a small amount of steam is continually discharged thru the seat, allowing the condensate to continually reach the steam trap. This steam lock release feature is available on ALL F&T and Thermostatic traps and should be considered on this type of application.

Introduction

A) Venting Air

- A)** When cold air enters the trap during start-up, the thermostatic air vent is open, allowing the discharge of large quantities of air from the system.

B) Discharging Condensate

- B)** When condensate enters the trap, the float lifts which opens the valve, allowing condensate to discharge. This image shows the valve/seat fully open and operating at full capacity.

C) Closed (Trapping Steam)

- C)** As the condensate discharges through the seat orifice, the float lowers, and shuts the valve. The float closes the valve with a level of condensate above the seating orifice to prevent loss of any steam. The float level rises and falls to modulate the seat opening in order to maintain a constant equilibrium between the incoming pressure and internal trap components, several orifice sizes are offered to accommodate various differential pressure ranges.

Steam Traps

Float & Thermostatic Steam Trap

WFT Series

Float & Thermostatic

Model	WFT
Sizes	3/4", 1", 1 1/4", 1 1/2", 2"
Connections	NPT
Body Material	Cast Iron
PMO Max. Operating Pressure	250 PSIG
TMO Max. Operating Temperature	Saturated Steam Temperature
PMA Max. Allowable Pressure	250 PSIG up to 450°F
TMA Max. Allowable Temperature	450°F @ 250 PSIG

Typical Applications

PROCESS, DRIP: WFT Series with parallel port connections were specifically designed for removing condensate and air from HVAC and industrial process applications such as unit heaters, pressing machines, heat exchangers and coils. They contain a high-quality welded stainless steel thermostatic air vent and stainless steel mechanism. The WFT Series are fully repairable while the trap remains in-line and are available in 3/4" thru 2" NPT connections. For drip applications, such as draining steam mains and steam supply lines, use model 3/4" WFT-125 (WFT-125-13-N).

How It Works

Float and thermostatic traps contain a float-operated valve and seat mechanism with a separate thermostatic element which work together to remove both condensate and air from the steam system. The float, which is attached to a valve, rises and opens the valve when condensate enters the trap, allowing the condensate to discharge. Air is discharged through the thermostatic air vent to the outlet side of the trap. Steam entering the trap causes the thermostatic element to expand, closing the air vent and trapping the steam.

Features

- All stainless steel internals with hardened seat and wear parts
- In-line repairability is simplified by having all internals attached to the cover
- Welded stainless steel thermostatic air vent resists shock from waterhammer. Live orifice air vent is available for superheated applications
- Excellent air handling capability allows air to be discharged rapidly so steam can enter the system quickly during start-up
- F&T traps discharge condensate immediately as it is formed (no condensate will back up into the system)

Sample Specification

The trap shall be of float and thermostatic design with cast iron body and parallel piping configuration. Thermostatic air vent to be welded stainless steel. All internals must be stainless steel with hardened seat area. Trap must be in-line repairable.

Installation and Maintenance

The trap must be installed upright and level for the float mechanism to operate properly. All internal components can be replaced with the trap connected in-line. Repair kits include thermostatic air vent, float, valve seat and disc, and gaskets. The standard thermostatic air vent can be damaged by superheat; therefore, in applications with superheated steam, the thermostatic air vent should be replaced with a special "live orifice" air vent.

Options

- Live orifice air vent for superheated steam applications.
- NPT Connection for freeze protection
- **SLR** = Steam lock release
- **VB** = Vacuum Breaker
- **DP** = Drain Plug

MATERIALS

Body & Cover	Cast Iron
Gasket	Grafoil
Cover Screws	Steel, GR5
Float	Stainless Steel, AISI 304
Internals	Stainless Steel, 300 Series
Thermostat	Stainless Steel
Valve Seat	Stainless Steel, 17-4 PH
Valve Disc	Stainless Steel, AISI 420F

Demonstration of Parallel piping connections:

How to Size / Order

The **Maximum Operating Pressure (PMO)** rating of model selected must meet or exceed the maximum steam pressure or the trap may not open. For example; the WFT-125 has a PMO of 125 psi. Condensate capacity (lbs/hr) of the trap is based on the differential pressure across the trap.

For Drip Applications: a 3/4" WFT size is generally sufficient to exceed warm-up loads with a 2X safety factor.

For process applications: The condensate loads (lbs/hr) are normally calculated at the maximum steam pressure; then an appropriate safety margin is applied in order to select a trap with sufficient capacity when operating at lower steam pressures. Reference full explanation of Safety Load Factors in Steam Trap Introduction section.

When a temperature control valve regulates the flow of steam to the process equipment (Heat Exchanger) being drained of condensate, it is recommended to select a trap with a PMO that exceeds the inlet steam pressure to the temperature control valve. This assures that under all operating conditions, the steam pressure will not exceed the PMO of the trap.

For Example: Process application has a maximum steam inlet pressure of 100 psi, a maximum condensate load of 2,500 lbs/hr and is discharging to a condensate return line with a possible back pressure of 25 PSIG. $\Delta P = 100 - 25 = 75$ PSI

To select trap: If the Safety Load Factor is chosen to be 2X max capacity at max differential pressure, then Trap should be selected based on 5,000 lbs/hr (2,500 x 2 = 5,000) at 75 PSI differential pressure with a PMO in excess of 100 PSIG

Selection: WFT-125-17-N, PMO=125 PSIG, 2" NPT with a condensate capacity of 7,460 lbs/hr at 75 PSI differential pressure.

FTT & FTTS Series

Float & Thermostatic

Model	FTT - Ductile Iron	FTTS - Stainless Steel
Sizes	1/2" - 2"	1/2" - 1"
Connections	NPT, 150# FLG (1" - 2")	NPT, SW 150# FLG
Body Material	Ductile Iron	316 Stainless Steel
PMO Max. Operating Pressure	300 PSIG	225 PSIG
TMO Max. Operating Temperature	Saturated Steam Temperature	
PMA Max. Allowable Pressure	350 PSIG up to 450°F	
TMA Max. Allowable Temperature	450°F @ 300 PSIG	

FTT - 1/2" & 3/4" available in NPT only.

FTTS - available in 1/2"-1" only; capacities same as 1/2"-3/4" FTT.

Typical Applications

DRIP, PROCESS: FTT Series steam traps with in-line pipe connections are used for the removal of condensate and air in HVAC and industrial process applications such as unit heaters, water heaters, pressing machines, heat exchangers and coils. They contain a high-quality welded stainless steel thermostatic air vent and stainless seat and mechanism. F&T traps have excellent air handling capability, making them a better choice than Inverted Bucket traps for most process applications. For drip applications, such as draining steam mains and steam supply lines, use 1/2" or 3/4" sizes.

How It Works

Float and thermostatic traps contain a float and seat mechanism with a separate thermostatic element which work together to remove both condensate and air from the steam system. The float, which is attached to a valve, rises and opens the valve when condensate enters the trap. This allows the condensate to discharge. Air is discharged through the thermostatic air vent to the outlet side of the trap. Steam entering the trap causes the thermostatic element to expand, closing the air vent and trapping the steam.

Sample Specification

The trap shall be of float and thermostatic design with ductile iron body and in-line piping configuration. Thermostatic air vent to be welded stainless steel. All internals must be stainless steel with hardened seat area. Trap must be in-line repairable.

Options

Live orifice air vent for superheated steam applications.

Drain connection - FTT: 1"-2"; FTTS: all sizes

FTTS only - Left, Right, or Vertical (downward) flow direction

SLR = Steam lock release

Installation and Maintenance

The trap must be installed upright and level for the float mechanism to operate properly. All internal components can be replaced with the trap body remaining in-line. Repair kits include thermostatic air vent, float, valve seat and disc, and gaskets. The standard thermostatic air vent can be damaged by superheat; therefore, in applications with superheated steam, the thermostatic air vent should be replaced with a special "live orifice" air vent.

Features

- Ductile Iron has a higher pressure and temperature rating and is more resistant to shock loads than cast Iron
- All stainless steel internals with hardened seat and wear parts
- In-line repairability is simplified by having all internals attached to the cover
- Welded stainless steel thermostatic air vent resists shock from waterhammer. Live orifice air vent is available for superheated applications
- Excellent air handling capability allows air to be discharged rapidly so steam can enter the system quickly during start-up
- F&T traps discharge condensate immediately as it is formed (no condensate will back up into the system)

How to Size / Order

The PMO (maximum operating pressure) rating of model selected must meet or exceed the maximum steam pressure or the trap may not open. For example; the FTT-145 has a PMO of 145 psi. Condensate capacity (lbs/hr) of the trap is based on the differential pressure across the trap. For drip applications, a 1/2" FTT size is generally sufficient to exceed warm-up loads with a 2X safety factor. The condensate loads (lbs/hr) for process applications are normally calculated at the maximum steam pressure; then an appropriate safety margin is applied in order to select the trap with sufficient capacity when operating at lower steam pressures. Reference full explanation of Safety Load Factors in Steam Traps Introduction section.

When a temperature control valve is regulating flow to the process equipment, it is recommended to select a trap with a PMO that will exceed the inlet steam pressure to the control valve.

For Example: Process application has a maximum steam inlet pressure of 100 psi, a maximum condensate load of 2,500 lbs/hr and is discharging to a condensate return line with a possible back pressure of 25 psig. $\Delta P = 100 - 25 = 75$ PSI

To select trap: If the Safety Load Factor is chosen to be 2X max capacity at max differential pressure, then Trap should be selected based on 5,000 lbs/hr (2,500 x 2 = 5,000) at 75 PSI differential pressure with a PMO in excess of 100 PSIG

Selection: FTT-145-16-N, PMO=145 PSIG, 1 1/2" NPT with a condensate capacity of 9,600 lbs/hr at 75 PSI differential pressure.

FTE Model shown

Typical Applications

PROCESS: FTE & FTES Series are high capacity steam traps specifically designed to remove condensate and air from HVAC and industrial process applications with extremely high condensate load requirements. Examples include reboilers, absorption chillers, large air-handling coils, large heat exchangers and other large process equipment. They are available with a ductile iron (FTE) or steel body (FTES) and contain a high quality welded stainless steel thermostatic air vent and stainless mechanism. F&T traps have excellent air-handling capability, making them a better choice than Inverted Bucket traps for most process applications.

Features

- Ductile Iron has a higher pressure and temperature rating and is more resistant to shock loads than Cast Iron
- Cast Steel Body will allow operating pressures and temperatures up to 300 PSIG and 450°F
- High capacity steam trap for draining large process equipment (over 100,000 lbs/hr)
- All stainless steel internals with hardened seat and wear parts
- In-line repairability is simplified by having all internals attached to the cover
- Welded stainless steel thermostatic air vent resists shock from waterhammer. Live orifice air vent is available for superheated applications
- Excellent air handling capability allows air to be discharged rapidly so steam can enter the system quickly during start-up
- F&T traps discharge condensate immediately as it is formed (no condensate will back up into the system)

How It Works

Float and thermostatic traps contain a float and seat mechanism with a separate thermostatic element which work together to remove both condensate and air from the steam system. The float, which is attached to a valve, rises and opens the valve when condensate enters the trap. This allows the condensate to discharge. Air is discharged through the thermostatic air vent to the outlet side of the trap. Steam entering the trap causes the thermostatic element to expand, closing the air vent and trapping the steam.

Sample Specification

The trap shall be of float and thermostatic design with ductile iron or cast steel body. The trap must incorporate all stainless steel internals with hardened seat and welded stainless steel thermostatic air vent. Trap must be in-line repairable.

Installation and Maintenance

The trap must be installed upright and level for the float mechanism to operate properly. All internal components can be replaced with the trap body remaining in-line. Repair kits include thermostatic air vent, float, valve seat and disc, and gaskets. The **FTES** Series have cast steel bodies and are available in 2½" NPT, socket weld and flange connections. The standard thermostatic air vent can be damaged by superheat; therefore, in applications with superheated steam, the thermostatic air vent should be replaced with a special "live orifice" air vent.

Options

Live orifice air vent for superheated steam applications.

Parallel-pipe inlet/outlet connections are standard as shown. An optional In-line inlet/outlet connection is available; contact factory.

SLR = Steam lock release

VB = Vacuum breaker

FTES shown with Optional Flanges

How to Size / Order

The PMO (maximum operating pressure) rating of model selected must meet or exceed the maximum steam pressure or the trap may not open. For example; the FTE-125 has a PMO of 125 psi. Condensate capacity (lbs/hr) of the trap is based on the differential pressure across the trap. The condensate loads (lbs/hr) for process applications are normally calculated at the maximum steam pressure; then an appropriate safety margin is applied in order to select a trap with sufficient capacity when operating at lower steam pressures. Reference full explanation of Safety Load Factors in Steam Traps Introduction section.

When a temperature control valve is regulating flow to the process equipment, it is recommended to select a trap with a PMO that will exceed the inlet steam pressure to the control valve.

For Example: Process application has a maximum steam inlet pressure of 100 psi, a maximum condensate load of 10,000 lbs/hr and is discharging to a condensate return line with a possible back pressure of 25 psig. $\Delta P = 100 - 25 = 75$ PSI

To select trap: If the Safety Load Factor is chosen to be 2X max capacity at max differential pressure, then Trap should be selected based on 20,000 lbs/hr (10,000 x 2 = 20,000) at 75 PSI differential pressure with a PMO in excess of 100 PSIG

Selection: FTE-200-17-N, PMO=200 PSIG, 2" NPT with a condensate capacity of 21,500 lbs/hr at 75 PSI differential pressure.

CAPACITIES — Condensate (lbs/hr)

Steam Traps

Float & Thermostatic Steam Trap

FT600 & FT601

Float & Thermostatic

Model	FT600 & FT601*
Sizes	3/4", 1", 1 1/2", 2"
Connections	NPT, SW, FLG
Body Material	Carbon Steel or 316SS
Options	Live Orifice Air Vent
PMO Max. Operating Pressure	450 PSIG
TMO Max. Operating Temperature	750°F
PMA Max. Allowable Pressure	990 PSIG @ 100°F
TMA Max. Allowable Temperature	750°F @ 670 PSIG

* FT601 Body Material is 316 SS
 FT600 Body Material is Carbon Steel

Typical Applications

PROCESS: FT600 Series steam traps with Cast Steel Body were specifically designed for removing condensate and air from higher pressure steam applications or where steel bodies are specified. They are typically used in chemical plants and petrochemical refineries on re-boilers, heat exchangers, and other critical process applications. The excellent air-handling capability of float and thermostatic traps make them a better choice than bucket traps for applications requiring quick system start-up. Maximum steam pressure is 450 PSIG. Note: Model FT601 is identical to FT600 except body material is 316 SS.

How It Works

Float and thermostatic traps contain a float and seat mechanism with a separate thermostatic element which work together to remove both condensate and air from the steam system. The float, which is attached to a valve, rises and opens the valve when condensate enters the trap. This allows the condensate to discharge. Air is discharged through the thermostatic air vent to the outlet side of the trap. Steam entering the trap causes the thermostatic element to expand, closing the air vent and trapping the steam.

Features

- Investment cast steel body and cover with class 400 shell rating (670 PSIG @ 750°F)
- Hardened stainless steel seat and disc for extended service life even at extreme temperatures and pressures
- Excellent air handling capability allows air to be discharged rapidly so steam can enter the system quickly during start-up
- In-line reparability is simplified by having all internals attached to the cover. Studded cover allows for easier removal of body.
- Welded stainless steel air vent resists shock from waterhammer. Live orifice air vent is available for superheated applications
- F&T traps discharge condensate immediately as it is formed (no condensate will back up into the system)

Options

Live orifice air vent for superheated applications.

SLR = Steam lock release

VB = Vacuum breaker

RL = Right to Left flow path. Consult factory.
 (Left to Right flow is standard)

Sample Specification

The steam trap shall be of the mechanical float type having cast steel bodies, horizontal in-line connections in NPT, SW, or flanged, and all stainless steel internals. Incorporated into the trap body shall be an all stainless steel welded thermal element air vent which is water hammer resistant. The air vent is to be located at the high point of trap body to assure proper venting of non-condensables. The trap body will be in-line renewable. All bodies and covers shall be class 400 shell design, suitable for 670 PSIG @ 750°F.

Installation and Maintenance

The trap must be installed upright and level for the float mechanism to operate properly. All internal components can be replaced while the steam trap remains connected to the piping (in-line repairable). Threaded studs are permanently installed into the cover assembly which greatly simplifies the removal and replacement of the body when servicing. Internal components include a high quality welded stainless steel thermostatic air vent and stainless steel seat and mechanism. The standard thermostatic air vent can be damaged by superheat; therefore, in applications with superheated steam, the thermostatic air vent should be replaced with a special "live orifice" air vent.

MATERIALS

FT 600: Body & Cover	Cast Steel, ASTM A-216
FT 601: Body & Cover	316 SS
Cover Studs	Steel, SA 193, GR B7
Cover Nuts	Steel, SA 194, GR 2H
Cover Gasket	Stainless Steel Reinforced Grafoil
Valve Assembly	Stainless Steel, AISI 431
Gasket, Valve Assembly	Stainless Steel Reinforced Grafoil
Pivot Assembly	Stainless Steel, 17-4 PH
Mounting Screws	Stainless Steel Hex Head, 18-8
Float	Stainless Steel, ASTM -240, 304
Air Vent Assembly	Thermostatic element 304 SS Optional: Live orifice

How to Size / Order

The **Maximum Operating Pressure (PMO)** rating of model selected must meet or exceed the maximum steam pressure or the trap may not open. For example, the **FT600-145** has a **PMO of 145 psi**. Condensate capacity (lbs/hr) of the trap is based on the differential pressure across the trap.

For Drip Applications: A (3/4)" FT600 size is sufficient to exceed warm-up loads with a 2X safety factor.

For process applications: The condensate loads (lbs/hr) are normally calculated at the maximum steam pressure; then an appropriate safety margin is applied in order to select a trap with sufficient capacity when operating at lower steam pressures. Reference full explanation of Safety Load Factors in Steam Traps Introduction section.

When a temperature control valve regulates the flow of steam to the process equipment (Heat Exchanger) being drained of condensate, it is recommended to select a trap with a PMO that exceeds the inlet steam pressure to the temperature control valve. This assures that under all operating conditions, the steam pressure will not exceed the PMO of the trap.

For Example: Process application has a maximum steam inlet pressure of 100 psi, a maximum condensate load of 2,500 lbs/hr and is discharging to a condensate return line with a possible back pressure of 20 psig. $\Delta P = 100 - 20 = 80$ PSI

To select trap: If the Safety Load Factor is chosen to be 2X max capacity at max differential pressure, then Trap should be selected based on 5,000 lbs/hr (2,500 x 2 = 5,000) at 80 PSI differential pressure with a PMO in excess of 100 PSIG

Selection: **FT600-145-16-N**, PMO=145 PSIG, 1 1/2" NPT with a condensate capacity of 9,900 lbs/hr at **80 PSI** differential pressure.

Connection Codes:

(**N**=NPT, **SW**=Socket Weld, **F150**=150# FLG, **F300**=300# FLG, **F600**=600# FLG)

Typical Applications

DRIP, PROCESS: FT Series steam traps are designed for operating pressures up to 75 PSIG. These float and thermostatic traps are used for lower pressure HVAC and light industrial process applications. They are used on unit heaters, water heaters, pressing machines, heat exchangers and coils. For drip applications, such as draining steam mains and steam supply lines, use 3/4" FT-075 (FT73-075-13-N). F&T traps have excellent air-handling capability, which make them a better choice than Inverted Bucket traps for most process applications. FT Series traps have a dual inlet-outlet H-Pattern connection allowing for additional flexibility in installation.

How It Works

Float and thermostatic traps contain a float and seat mechanism with a separate thermostatic element which work together to remove both condensate and air from the steam system. The float, which is attached to a valve, rises and opens the valve when condensate enters the trap. This allows the condensate to discharge. Air is discharged through the thermostatic air vent to the outlet side of the trap. Steam entering the trap causes the thermostatic element to expand, closing the air vent and trapping the steam.

Sample Specification

The trap shall be of float and thermostatic design with cast iron body. Thermostatic element to be welded stainless steel. Float and seating material to be stainless steel. Trap must be in-line repairable.

Features

- H-pattern design allows piping from either side of the steam trap (there are two inlet ports at top and two outlet ports at bottom)
- F&T traps have excellent air handling capability allows air to be discharged rapidly and steam to enter the system quickly during start-up
- Welded stainless steel thermostatic air vent resists shock from waterhammer
- In-line repairable (all internals are attached to cover)

Installation and Maintenance

The trap must be installed upright and level for the float mechanism to operate properly. All internal components can be replaced with the trap body piped in-line. Repair kit includes thermostatic element, valve seat and disc, float and sealing gasket.

Helpful Selection Information

Select a model that can handle the maximum working pressure of the steam system. For example, the FT3-015 has a maximum working pressure of 15 PSI. Consult capacity tables to properly size unit. Available in 3/4" through 2" NPT connections. Select these models for steam systems with maximum working pressure of 75 PSIG.

Body & Cover	Cast Iron, ASTM A-126 Class B
Nuts & Bolts	High-Tensile Steel
Gasket	Grafoil/Garlock
Float	Stainless Steel
Valve & Seat	Stainless Steel
Thermostatic Assembly	Stainless Steel Bellows & Valve

How to Size / Order

The maximum operating pressure (PMO) rating of model selected must meet or exceed the maximum steam pressure or the trap may not open. Reference full explanation of Safety Load Factors in Steam Traps Introduction section.

For Example: Process application has a maximum steam inlet pressure of 50 psi, a maximum condensate load of 1,700 lbs/hr and is discharging to a condensate return line with a possible back pressure of 10 psig. $\Delta P = 50 - 10 = 40$ PSI

To select trap: If the Safety Load Factor is chosen to be 2X max capacity at max differential pressure, then Trap should be selected based on 3,400 lbs/hr (1,700 x 2 = 3,400) at 40 PSI differential pressure with a PMO in excess of 50 PSIG

Selection: **FT77L-075-16-N**, PMO=75 PSIG, 1 1/2" NPT with a condensate capacity of 3,750 lbs/hr at 40 PSI differential pressure.

PMO = Maximum Operating Pressure

Inverted Bucket Traps

The Inverted Bucket Trap, with its rugged design, offers features that are advantageous in certain conditions. The discharge orifice of the IB is mounted at the top of the trap, making them less susceptible to failure from dirt and pipe scale when compared to other trap types. Although they are typically not the primary choice for process applications due to their lack of air venting capability, they are often used in drip applications. They can be used on less critical process applications which do not require venting of air during system start-up or when a secondary air vent is added to the system.

Introduction

INVERTED BUCKET TRAPS.

Operation:

Due to its weight, the inverted bucket within the trap will rest on the bottom of the trap body keeping the valve open and allowing condensate to be discharged (**Figure A**). In the top of the bucket there is a small bleed hole which allows air to escape from inside the bucket and exit through the outlet port (**Figure B**). When steam arrives through the inlet of the trap, it fills the inverted bucket which makes it buoyant and rise to the top of the trap, closing the valve (**Figure C**). As steam condenses and/or is bled through the small bleed hole in the top of the bucket, the bucket loses buoyancy which causes it to sink to the bottom of the trap. The valve then opens allowing condensate to be discharged from the system (**Figure A**). The bucket trap must maintain a certain amount of water (prime) in order to operate. If the trap loses its prime, the bucket will not be able to float when steam enters; keeping the valve in the open position which allows steam to escape (**Figure D**). Due to the balance of forces required between the incoming pressure and internal trap components, several orifice sizes are required to accommodate various differential pressure ranges. For this reason care must be used to select a trap model with an equal or higher PMO rating than the steam pressure.

A) Discharging Condensate

B) Discharging Air

A) With condensate completely filling the trap, the bucket is in the down position with the valve open, allowing condensate to be discharged.

B) Small amounts of air will pass thru the bleed hole on top of the bucket and be discharged. (Note: Large amounts of air will lift the bucket and close off the valve, temporarily air locking the system.)

C) When steam enters the trap, the inverted bucket fills with steam and floats to the surface, closing off the valve, preventing steam from escaping.

C) Closed (Trapping Steam)

D) Potential Failure Mode Loss of Prime

D) Potential Failure Mode: Bucket traps must maintain a water prime to function properly. If the prime is lost, the bucket will remain in the down position with the valve open, and live steam will be discharged from the system.

Steam Traps

Inverted Bucket Steam Trap

SIB/SIBH
Inverted Bucket

Model	SIB, SIBH
Size	1/2", 3/4"
Connections	NPT, SW
Body Material	Stainless Steel
PMO Max. Operating Pressure	450 PSIG*
TMO Max. Operating Temperature	750°F
PMA Max. Allowable Pressure	720 PSIG @ 100°F
TMA Max. Allowable Temperature	750°F @ 400 PSIG

Typical Applications

DRIP, TRACING: The **SIB & SIBH** Inverted Bucket Steam traps are suitable for removing condensate from steam mains and steam supply lines. They are also used on unit heaters, laundry equipment, and other smaller, low capacity and less critical process applications where slow start-up can be tolerated. The discharge orifice of the inverted bucket trap is mounted at the top of the trap body, which makes them less susceptible to failure from dirt and debris when compared to other trap types. The SIBH is physically larger and has a higher pressure capability for a particular orifice size than the SIB.

How It Works

When the trap is filled with condensate, the inverted bucket inside the steam trap loses its buoyancy and rests on the bottom of the trap. This pulls the disc off the seat allowing condensate to be discharged through the seat orifice located at the top of the trap. When steam enters, it fills the inverted bucket causing the bucket to float to the surface which closes the discharge valve, containing the steam in the system. Eventually, the steam is bled off through a small hole in the top of the bucket causing it to sink, which repeats the cycle.

Features

- All stainless steel body
- Acceptable for superheated steam (with check valve installed at inlet)
- Waterhammer resistant
- Valve & seat are located at the top of the trap body making them less prone to clogging from debris and pipe scale
- All stainless steel internals with hardened valve & seat

SIB
Inverted Bucket
Steam Trap

Sample Specification

Steam trap shall be an all stainless steel module design inverted bucket type with a frictionless valve lever assembly.

Option

CV = built-in Inlet Check Valve recommended for Superheated Steam

Installation and Maintenance

Trap must be installed in upright position to function properly. The stainless steel body is seal welded and therefore non-repairable. If a new trap is required, remove and replace. Bucket traps require an internal water seal to operate. Applications with superheated steam can cause the water seal to flash into steam and trap to fail in open position. A check valve installed at trap inlet will help prevent the loss of prime.

MATERIALS

Helpful Selection Information

The PMO (maximum operating pressure) rating of model selected must meet or exceed the maximum steam pressure or the trap may not open. For example; the **SIB-12-N-150** has a PMO of 150 PSI. Condensate capacity (lbs/hr) of the trap is based on the differential pressure across the trap.

Inverted Bucket

Model	1031, 1032, 1033, 1034, 1041, 1042, 1044, 1038S
Sizes	1/2", 3/4", 1", 1 1/4", 1 1/2"
Connections	NPT
Body Material	Cast Iron
Options	Internal check valve, Thermic vent
PMO Max. Operating Pressure	250 PSIG
TMO Max. Operating Temperature	450°F
PMA Max. Allowable Pressure	250 PSIG up to 450°F
TMA Max. Allowable Temperature	450°F @ 250 PSIG

**1031/1032
1033/1034**
(No Strainer)

**1041/1042
1044/1038S**
(with Strainer)

Typical Applications

DRIP TRACING PROCESS: IB Series inverted bucket steam traps are primarily intended for drip applications; to remove condensate from steam mains and steam supply lines. The smaller sized units have adequate capacity for the majority of drip applications. The discharge orifice of the inverted bucket trap is mounted at the top of the trap body, which makes them less susceptible to failure from dirt and debris when compared to other trap types. Since Inverted Bucket traps have poor air-handling capability, they are normally not recommended for most process applications. However, they can be used on certain process applications such as unit heaters and laundry equipment, where discharging air during system start-up is not a critical factor. F&T traps are the preferred choice for systems where air *must* be quickly discharged.

How It Works

When the trap is filled with condensate, the inverted bucket inside the steam trap loses its buoyancy and rests on the bottom of the trap. This pulls the disc off the seat allowing condensate to be discharged through the seat orifice located at the top of the trap. When steam enters, it fills the inverted bucket causing the bucket to float to the surface which closes the discharge valve, containing the steam in the system. Eventually, the steam is bled off through a small hole in the top of the bucket causing it to sink, which repeats the cycle.

Features

- Waterhammer resistant
- Suitable for superheated steam
(use internal check valve option to eliminate loss of prime)
- In-line repairability is simplified by having all internals attached to the cover
- Valve & seat are located at the top of the trap body making them less prone to clogging from debris and pipe scale
- All stainless steel internals with hardened valve & seat

Sample Specification

The steam trap shall be of an inverted bucket trap design. Trap body and cover shall be of cast iron construction with all stainless steel internals and hardened seat and disc.

Installation and Maintenance

Trap must be installed in upright position to function properly. All working components can be replaced with the trap body remaining in-line. With superheated steam, a check valve should be installed at inlet or trap may lose prime. A replacement kit containing the lever and seat assembly is a more economical option than replacing the entire steam trap. Also available are replacement screens, gaskets and buckets. When ordering replacement lever and seat assemblies, specify model and operating pressure. See Replacement Parts and Kits Section for exact cross-reference to Armstrong PCA (Pressure Change Assembly) kits.

Helpful Selection Information

Select a model with a higher maximum operating pressure (PMO) that meet or exceed the maximum steam pressure or the trap may not open. For example, the **IB-1032-14-N-250** has a PMO of 250 PSI. Choose a model that will handle the capacity requirement based on the differential pressure across the trap. Reference capacity charts.

Options

Strainer and Blowdown valve connection available on 1041, 1042, 1044 & 1038S. Thermic vent to improve air handling capability. Internal check valve for superheated or condensate backflow applications.

* With Integral Strainer

How to Order Options: (reference model code chart)

Check Valve (suffix CV)

Built-in Inlet Check Valve is recommended when used on Superheated Steam

Example: **IB1032-12-N-125-CV**

Thermic Vent (suffix TV)

A Thermic Vent is recommended when using a Bucket Trap on any type of process application or where the removal of air from the system is critical.

Example: **IB1032-12-N-125-TV**

Thermic Vent & Check Valve (suffix TCV)

For both Check Valve & Thermic Vent Options use Suffix Code

Example: **IB1032-12-N-125-TCV**

Blowdown Valve (add B to Model Code)

Blowdown connection is available on Models IB1038S, 1041, 1042 and 1044

Example: **IB1041B-13-N-150**

(Model IB1041, 3/4" NPT, 150 PSI max operating pressure with Blowdown & Strainer)

MATERIALS

Body & Cover	Cast Iron, ASTM A-278 Class 30
Nuts & Bolts	High-Tensile Steel
Gasket	Garlock
Bucket	Stainless Steel
Lever & Seat Assembly	Stainless Steel
Valve & Seat	Hardened Stainless Steel
Integral Strainer*	Stainless Steel

* 1031S, 1038S, 1041, 1042, 1044 models only.

How to Size / Order

From the capacity chart, select the model that can handle the working pressure of the system (PMO). Select the appropriate trap that will meet the capacity requirements at the differential pressure. Example:

Application: 1000 lbs/hr at 75 PSIG working pressure and 2 PSI differential pressure

Note: Specify Model, PMO and Connection Size

Size/Model: **IB-1034, 80 PSIG**, Specify pipe size (3/4", 1"), or **IB-1044, 80 PSIG**, Specify pipe size (3/4", 1")

Helpful Selection Information

Select a model with a higher maximum operating pressure (PMO) that meet or exceed the maximum steam pressure or the trap may not open. For example, the **IB-1032-14-N-250** has a PMO of 250 PSI. Choose a model that will handle the capacity requirement based on the differential pressure across the trap. Reference capacity charts.

CAPACITIES — Condensate (lbs/hr)

* 1031S only available @ PMO = 125 PSIG.

Steam Traps

Inverted Bucket Steam Trap

IB Series

Inverted Bucket

Replacement Kits

A replacement kit containing the lever and seat assembly is a more economical option than replacing the entire steam trap. Also available are replacement screens, gaskets and buckets.

When ordering replacement lever and seat assemblies specify model and operating pressure. See Replacement Parts and Kits Section for exact cross-reference to Armstrong PCA (Pressure Change Assembly) Kits.

Why use a Check Valve Option ?

The optional internal check valve allows the bucket trap to retain its prime even when exposed to superheated steam. The IB Trap must retain hot condensate inside the trap body to operate. Superheated steam or a sudden drop in inlet pressure can flash off the hot condensate inside the trap body causing the trap to lose its prime. If the steam pressure falls below the discharge pressure on the outlet side of the steam trap, the internal check valve will stop the back flow of condensate into the steam system. When discharging to a condensate return line, a check valve is always recommended.

Steam Trap Installed Above Condensate Collection Point

In this example, condensate must travel upwards to reach the trap. Under this condition, it is possible for condensate to flow from the condensate return line into the steam coils, thereby flooding the system. The internal check valve, inside the IB trap, prevents the back flow of condensate.

Steam Trap Discharging into Elevated Condensate Return Line

When a steam trap discharges condensate to an elevated location, a check valve should be used to stop condensate from flowing backwards into the steam system.

Why use a Thermic Vent ?

The Thermic Vent is used for discharging air from the steam system during start-up.

Blowdown Valve Connection

A Blowdown Valve connection is available as an option on the **1041**, **1042**, **1044**, and **1038S** models. This simplifies maintenance by allowing the strainer to be cleaned without removal. User to supply blowdown valve.

1031S

The **1031S** is equipped with a small protection screen to guard against dirt in the steam system. It is a more economical alternative than the 1041 which has a full-port strainer. Specifically designed for use in laundries. Available in 125 PSIG model only.

Quick-Change Universal Style Trap Connectors Trap Modules & Manifolds

Quick-Change Universal Style Trap Connectors

Trap Modules & Manifolds

UC450 Series

Quick-Change Universal Style Trap-Connector System

The **UC450 Series QUICK-CHANGE Universal Trap-Connector System** with multiple choices for trap modules and multiple choices for connectors are used in steam systems where a simplified and economical maintenance program of steam traps is desired. These Universal Style quick replacement steam traps can be used on steam supply lines as well as for tracing and small process applications. They are commonly used in chemical plants, petrochemical refineries, paper mills and other industrial facilities.

The All Stainless Steel Universal Style Steam Traps feature a permanent installation of the Universal Connector with a 2-bolt mounting arrangement for the Universal Steam Trap Module, allowing the Steam Trap to be removed and replaced in minutes:

- Steam trap is replaced without having to unthread piping
- By removing only 2 bolts with a socket or open-end wrench
- Trap module can swivel 360° on the universal connector allowing proper orientation

**"QUICK-CHANGE" Universal Trap Modules**

STEP 1:
Select an appropriate
Universal
**STEAM TRAP
MODULE**

**"QUICK-CHANGE" Universal Connectors**

STEP 2:
Select appropriate Universal **CONNECTOR**.
Any Universal Connector (shown right) will
work with any Universal Steam Trap Module.
(Including those of other manufacturers. See
product catalog for full offering of Connectors.)
Trap orientation must be considered.

Quick-Change Universal Style Trap-Connector System

UC450 Series

STEAM TRAPS

Why Use the UC450 Series "QUICK-CHANGE" Universal Style Trap-Connector System ?

Quick-Change Steam Traps

are recommended in any application – particularly those which require simple and frequent replacement of steam traps

Universal Connectors

These Connectors remain permanently installed in the piping system. The convenient 2-bolt mounting system allows the Trap Module to be replaced quickly and easily using a socket or open-end wrench without having to unthread piping.

UT450 Steam Trap
(shown with)

UC450SB Connector

4 basic configurations of connectors are available:

UC450, UC450S & UC450R/
UC450L.

Choice is based on strainer orientation or if a piping interference exists.

The UC450SR is the standard connector choice.

The R & L versions are a mirror image of each other and are strictly a user's preference based on piping orientation.

UC450

UC450S

UC450SR

UC450 Series

Universal Style Quick-Change Connectors

(For use with **Universal Quick-Change Trap Modules**)

Model	UC450, UC450S, UC450SB UC450SR, UC450SBR, UC450SL, UC450SBL
Sizes	1/2", 3/4", 1"
Connections	NPT, SW, FLG*, Tube Weld*
Body Material	Stainless Steel
PMO Max. Operating Pressure	(trap module dependent)
TMO Max. Operating Temperature	(trap module dependent)
PMA Max. Allowable Pressure	750 PSIG @ 100°F
TMA Max. Allowable Temperature	800°F @ 400 PSIG

Steam Trap Modules that mount to Universal Connectors are shown on the following pages. Trap modules available in: Inverted Bucket, Float & Thermostatic, Thermodynamic, Thermostatic and Bi-metallic type.

Typical Applications

DRIP, TRACER: UC450 Series Universal Trap Connectors reduce the time and manpower to replace steam traps. The stainless steel Connector remains permanently in-line allowing steam trap module to be replaced in minutes. These universal connectors can be used for drip service on steam mains and steam supply lines, tracing, or for small process equipment. Industrial standard 2-bolt universal connectors are commonly used in chemical plants, petrochemical refineries, paper mills, and other industrial facilities. The UC450 connectors conform to industrial standards, making them compatible with other manufacturers' universal steam trap modules.

Used with the following Watson McDaniel Steam Trap Modules:

USIB450	- Inverted Bucket
UTD450	- Thermodynamic
UTD450SM	- Thermodynamic
UTD600LSM	- Thermodynamic
UT450	- Thermostatic
UFT450	- Float & Thermostatic
UB450	- Bi-Metallic

*Customized Flanged and Tube Fitting connections available; consult factory.

How It Works

Universal connectors remain permanently installed in the piping system. The convenient 2-bolt mounting system allows the trap module to be removed and replaced quickly and easily using a socket or open-end wrench without disturbing the existing piping.

Features

- Universal connector with 2-bolt mounting allows for fast, easy replacement of trap module making it more cost-effective than replacing conventional type steam traps
- All stainless steel construction
- Trap module can rotate 360° on the universal connector allowing any orientation during installation
- Compatible with other manufacturers' trap modules
- Available with integral strainer and blowdown valve

Sample Specification

The Universal Connector shall be all stainless steel construction with a two-bolt 360 degree swivel mount flange design and available with integral strainer and blowdown valve.

Installation and Maintenance

The universal connector can be installed in vertical or horizontal piping and available in 1/2", 3/4" and 1" threaded NPT and socket weld (SW). In horizontal installations, orientation of connector body may be dependent on the specific type of trap module used. These connectors remain permanently installed in the piping system. The convenient 2-bolt mounting system allows the trap module to be easily replaced

MATERIALS

Body	Stainless Steel, AISI 316
Strainer	40 Mesh Stainless Steel, AISI 304
Blowdown Valve	Stainless Steel, AISI 303

How to Size / Order

Connectors and Trap Modules are ordered separately. See following pages for the Trap Modules.

UC450 Series

Universal Style Quick-Change Connectors

(For use with **Universal Quick-Change Trap Modules**)

Helpful Selection Information
Choose the desired style connector:
UC450, UC450S
UC450SR (flow to right)
UC450SL (flow to left)

Four basic configurations of connectors are available: UC450, UC450S, and UC450SR/UC450SL. The UC450SR (with strainer, flow to right) is the most common connector choice. Choice is based upon strainer orientation or if a piping interference exists. All connector styles operate with any trap module. The **R** and **L** versions are mirror images of each other and are selected based on which side the user prefers the trap mounted on.

Typical Examples of Trap Modules & Connectors

USIB450

Universal Style Quick-Change Trap Module

Inverted Bucket Steam Trap Module (mounts to UC450 Universal Connectors)

Model	USIB450, USIB450H
Connections	Fits UC450 Series Universal Connectors
Body Material	Stainless Steel
PMO Max. Operating Pressure	450 PSIG*
TMO Max. Operating Temperature	800°F
PMA Max. Allowable Pressure	720 PSIG @ 100°F
TMA Max. Allowable Temperature	800°F @ 400 PSIG

*750°F @ operating pressures below 400 PSIG. See installation note regarding using trap in superheated applications.

Steam trap modules **can be used** with other manufacturers' Universal Connectors.

Typical Applications

DRIP, TRACER: The **USIB450** inverted bucket steam trap modules must be mounted to a universal connector. They are typically used for drip applications such as draining condensate from steam mains or steam supply lines as well as for steam tracing applications. **USIB450H** is the high capacity model.

How It Works

The UC450 universal connector is permanently installed into the pipeline where the steam trap would normally be placed. The trap module, which functions like any standard inverted bucket steam trap, is fastened to the universal connector with two bolts. When a new trap module is needed, it can be easily removed and replaced with a standard open-end or socket wrench without disturbing the existing piping.

Sample Specification

The steam trap shall be an all stainless steel modular design, inverted bucket type with a frictionless valve lever assembly. The trap shall have a 360 degree swivel mount on a stainless steel Universal Connector that is available with integral strainer and blowdown valve options.

Options

Universal Connectors are available with an integral strainer and blowdown valve. Connector is purchased separately.

See the UC450 Universal Connectors section for more information.

- **CV** = built-in Inlet Check Valve recommended for Superheated Steam

When using Flanged UC450 Connectors in vertical piping, special Module options are available ; Contact factory.

Installation and Maintenance

Universal connector is first permanently threaded or welded into piping system. The USIB trap module is attached to the universal connector with two bolts. When a new trap is needed, it can be easily removed and replaced with a standard open-end or socket wrench without disturbing the existing piping. Trap must be installed in upright position as shown to function properly. With superheated steam, a check valve must be installed at inlet of trap to prevent the loss of prime. In vertical piping installations with upward flow, use of a blowdown valve is not recommended because discharge would be in upward and possibly unsafe direction.

Features

- Trap module can be easily removed and replaced in minutes without having to disconnect any piping
- Hardened stainless steel valves and seat
- Freeze resistant
- Connectors available with integral strainers and blowdown valves
- 360° swivel design for convenient installation

UFT450

Universal Style Quick-Change Trap Module

Float & Thermostatic Steam Trap Module (mounts to UC450 Universal Connectors)

Model	UFT450
Connections	Fits UC450 Series Universal Connectors
Body Material	Stainless Steel
PMO Max. Operating Pressure	450 PSIG
TMO Max. Operating Temperature	397°F
PMA Max. Allowable Pressure	720 PSIG @ 100°F
TMA Max. Allowable Temperature	800°F @ 400 PSIG

UFT450

Float & Thermostatic
Steam Trap Module

Steam trap modules can be used with other manufacturers' Universal Connectors.

Typical Applications

PROCESS, DRIP: The UFT450 Float & Thermostatic steam trap module can be used on small process equipment that generates light condensate loads and requires excellent air handling capability. These low capacity F&T trap modules can also be used in drip service on steam mains and steam supply lines. Mounts to any universal connector.

How It Works

The UC450 universal connector is permanently installed into the pipeline where the steam trap would normally be placed. The trap module, which functions like any F&T steam trap, is fastened to the universal connector with two bolts. When a new trap module is needed, it can be easily removed and replaced with a standard open-end or socket wrench without disturbing the existing piping.

Sample Specification

The steam trap shall be an all stainless steel modular design, float & thermostatic unit. The thermostatic air vent to be pressure balanced welded bellows. The trap shall have a 360 degree swivel mount on a stainless steel Universal Connector that is available with integral strainer and blowdown valve options.

Installation and Maintenance

Universal connector is first permanently threaded or welded into piping system. The UFT450 mounts to any 2-Bolt Quick-Change Universal Connector. Trap module must be installed in orientation shown. The trap module is bolted to the universal connector with two bolts. When a new trap module is needed, it can be easily removed and replaced with a standard open-end or socket wrench without disturbing the existing piping.

Features

- Trap module can be easily removed and replaced in minutes without having to disconnect any piping
- Hardened stainless steel valves and seat
- Freeze resistant
- Connectors available with integral strainers and blowdown valves
- 360° swivel design for convenient installation

Options

Universal Connectors are available with an integral strainer and blowdown valve. Connector is purchased separately See the Universal Connectors section for more information.

SLR = Steam Lock Release

Helpful Selection Information

Select a model that can handle the maximum working pressure of the steam system. For example, the UFT450-65 has a maximum working pressure of 65 PSI.

MATERIALS

**UTD450SM
&
UTD600SM**
**Thermodynamic
Steam Trap Module**
(Side Mount Style)
For vertical or horizontal
piping installations.

Steam trap modules can be used with other manufacturers' Universal Connectors.

Typical Applications

DRIP, TRACER: Designed for drip applications for the draining of condensate from steam mains and other steam supply lines as well as for tracing applications. The **UTD450SM & UTD600SM** Steam Trap Modules can be used anywhere conventional thermodynamic steam traps are used. This trap module can be used on either vertical or horizontal piping installations and can mount to any 2-bolt Quick-Change Universal Connector.

How It Works

The UC450 universal connector is permanently installed into the pipeline where the steam trap would normally be placed. The trap module, which functions like any thermodynamic steam trap, is fastened to the universal connector with two bolts. When a new trap module is needed, it can be easily removed and replaced with a standard open-end or socket wrench without disturbing the existing piping.

Features

- Trap module can be easily removed and replaced in minutes without having to disconnect any piping
- Trap modules can be used with most manufacturers' 2-bolt universal connector
- All stainless steel construction with hardened seat

Sample Specification

The steam trap module shall be designed to attach to the industry standard two-bolt universal connector. Trap module shall be of a thermodynamic design. Universal connector shall conform to the two bolt industry standard with integral strainer and blowdown options.

Installation and Maintenance

Universal connector is first permanently installed (threaded, welded, flanged) into piping system. Trap module should be installed in orientation shown with cap facing upwards. The trap module is fastened to the universal connector using two bolts. If the trap fails for any reason, replace only the trap module. In vertical piping installations with upward flow, use of a blowdown valve is not recommended. Discharge would be in upward and unsafe direction.

Options

Universal Connectors are available with an integral strainer and blowdown valve. Connector is purchased separately. See the Universal Connectors section for more information.

Helpful Selection Information

Connector selection to use with the UTD450SM and UTD600LSM: UC450 (no strainer), UC450SR (strainer), UC450SBR (strainer and blowdown).

UTD450
**Thermodynamic
Steam Trap Module**
(Top Mount Style)
Recommended for horizontal
piping installations only
so that cap can be
oriented upwards as shown.

Steam trap modules can be used with other manufacturers' Universal Connectors.

Typical Applications

DRIP, TRACER: Designed to work as a drip trap for the draining of condensate from steam mains and other steam supply lines, the **UTD450** Thermodynamic Steam Trap Module can be used anywhere conventional thermodynamic steam traps are used. Can also be used on tracing applications. This model is only recommended for horizontal piping installations to allow the cap to be oriented upwards. The UTD450 mounts to any 2-bolt Quick-Change Universal Connector.

The UTD450 is recommended for horizontal piping only so that cap can be oriented upwards, as shown.

How It Works

The UC450 universal connector is permanently installed into the pipeline where the steam trap would normally be placed. The trap module, which functions like any thermodynamic steam trap, is fastened to the universal connector with two bolts. When a new trap module is needed, it can be easily removed and replaced with a standard open-end or socket wrench without disturbing the existing piping.

Features

- Trap module can be easily removed and replaced in minutes without having to disconnect any piping
- Trap modules can be used with most manufacturers' 2-bolt universal connector
- All stainless steel construction with hardened seat

Sample Specification

The steam trap module shall be designed to attach to the industry standard two-bolt universal connector. Trap module shall be of a thermodynamic design. Universal connector shall conform to the two bolt industry standard with integral strainer and blowdown options.

Installation and Maintenance

The UTD450 Trap module was intended for horizontal piping installations so the trap can be installed with cap facing upwards. Trap module is attached to the connector using two bolts. If the trap fails for any reason, replace only the trap module. When a new trap module is needed, it can be easily removed and replaced with a standard open-end or socket wrench without disturbing the existing piping.

Options

Universal Connectors are available with an integral strainer and blowdown valve. Connector is purchased separately. See the Universal Connectors section for more information.

Helpful Selection Information

Connector selection to use with the UTD450: UC450 (no strainer), UC450S (strainer), UC450SB (strainer and blowdown). Select this model for steam systems with maximum working pressure of 450 PSIG.

UT450

Universal Style Quick-Change Trap Module

Thermostatic Steam Trap Module (mounts to UC450 Universal Connectors)

Model	UT450
Connections	Fits UC450 Series Universal Connectors
Body Material	Stainless Steel
PMO Max. Operating Pressure	450 PSIG
TMO Max. Operating Temperature	Saturated Steam Temp.
PMA Max. Allowable Pressure	720 PSIG @ 100°F
TMA Max. Allowable Temperature	800°F @ 400 PSIG

UT450
Thermostatic
Steam Trap
Module

Steam trap modules can be used with other manufacturers' Universal Connectors.

Typical Applications

DRIP, TRACER, PROCESS: The **UT450** Thermostatic Steam Trap Module can be used anywhere conventional thermostatic steam traps are used. Used for drip, tracing and light process applications. Trap module mounts to any 2-bolt Quick-Change Universal Connector.

How It Works

The UC450 universal connector is permanently installed into the pipeline where the steam trap would normally be placed. The trap module is fastened to the universal connector with two bolts. When a new trap module is needed, it can be easily removed and replaced with a standard open-end or socket wrench without disturbing the existing piping.

Features

- Trap module can be easily removed and replaced in minutes without having to disconnect any piping
- Trap modules can be used with most manufacturers' 2-bolt universal connector
- All stainless steel construction with hardened seat

Sample Specification

The steam trap module shall be designed to attach to the industry standard two-bolt universal connector. Trap module shall be of a thermostatic design. The universal connector shall conform to the two-bolt industry standard with integral strainer and blowdown options.

Installation and Maintenance

Mounts to any two-bolt quick change universal connector. Trap module is attached to the connector using two bolts and two sealing gaskets. When a new trap module is needed, it can be easily removed and replaced with a standard open-end or socket wrench without unthreading the existing piping. In vertical piping installations with upward flow, use of a blowdown valve is not recommended. Discharge would be in upward and unsafe direction.

Options

Universal Connectors are available with an integral strainer and blowdown valve. Connector is purchased separately. See the Universal Connectors section for more information.

Special 43°F Sub-cool Bellows available.

(Note: Standard bellows are designed for approximately 5°F sub-cool temperature)

Helpful Selection Information

Connector selection to use with the UT450: UC450 (no strainer), UC450SR (strainer), UC450SBR (strainer and blowdown). Select this model for steam systems with maximum working pressure of 450 PSIG.

UB450

Universal Style Quick-Change Trap Module

Bi-Metallic Steam Trap Module (mounts to UC450 Universal Connectors)

Model	UB450
Connections	Fits UC450 Series Universal Connectors
Body Material	Stainless Steel
PMO Max. Operating Pressure	450 PSIG
TMO Max. Operating Temperature	662°F
PMA Max. Allowable Pressure	720 PSIG @ 100°F
TMA Max. Allowable Temperature	800°F @ 400 PSIG

Steam trap modules can be used with other manufacturers' Universal Connectors.

Typical Applications

The **UB450** Series Bi-Metallic Steam Trap Modules are used in steam tracing applications (for process line heating, instrumentation and winterization, general steam jacketing). In tracing applications, the externally-adjustable (temperature adjustment) bi-metal element provides accurate control of condensate discharge temperature as required to maintain a specific product temperature as well provide maximum usage of energy.

How It Works

The UB450 contains bi-metallic plates of dissimilar metals that respond to steam temperature variations by expanding or contracting, depending upon the temperature, allowing condensate and air to discharge when cool, and trapping steam when hot. Condensate discharge temperature is field-adjustable. The trap module is fastened to the universal connector using 2-bolts.

Features

- Excellent for various steam tracing and small process applications where maximum energy usage is desired
- Field-adjustable bimetal element allows precise control of condensate discharge temperature, providing maximum use of additional energy in the condensate
- Internal screen and seat/plug design help prevent pipe scale and debris from accumulating on seating surfaces to provide trouble-free operation

Installation and Maintenance

Universal connector is first permanently threaded or welded into piping system. Trap module is attached to the universal connector using two bolts. If the trap fails for any reason, replace only the trap module. In vertical piping installations with upward flow, use of a blowdown valve is not recommended. Discharge would be in upward and unsafe direction.

TMA Max. Allowable Temperature	750°F @ 450 PSIG

UTD450H/HSP
Steam Trap Module

UC450H
Connector

Typical Applications

The **UTD450H** Series is a highly specialized Thermodynamic Steam Trap Module. Designed to mount on 1" UC450H Universal Quick-Change connectors, it offers **extremely high capacity** capability for special drip applications such as steam tunnels and manholes where long distances between steam traps and deteriorating pipe insulation are common. Combined with potential groundwater accumulations, capacity requirements in these applications far exceed normal drip applications. With only 2- bolts the non-swivel steam trap module can be quickly replaced making this design ideally suited for hazardous locations. Two bottom port options are included for possible monitoring.

The **UTD450HSP** is a higher capacity version. Module and connector comply with ASME B31.1 Power Piping.

Typical Applications

The UTD450H steam trap module can be installed in any orientation for normal operation.

Helpful Selection Information

The UTD450H is a special high capacity steam trap module and should only be used in applications where their capacity capabilities are appropriate. Consult factory for sizing and application assistance. Steam Trap Module and Connector are purchased separately.

Model	UTS600
Sizes	1/2", 3/4", 1"
Connections	NPT, SW, FLG
Body Material	Stainless Steel
PMO Max. Operating Pressure	(trap module dependent)
TMO Max. Operating Temperature	(trap module dependent)
PMA Max. Allowable Pressure	1440 PSIG @ 100°F
TMA Max. Allowable Temperature	800°F @ 845 PSIG

The UTS600 Steam Trap Test Station contains Inlet & Outlet Isolation Valves, Blowdown Valve & Steam Trap Test Valve.

Typical Applications

DRIP, TRACER: UTS600 Series Universal Connector Steam Trap Test Station reduce the time and manpower to test and replace steam traps. The Trap Test Station remains permanently in-line allowing steam trap module to be replaced in minutes. Integral isolation valves and trap test valve allow for simple trap testing by visually inspecting trap discharge. These Trap Test Stations can be used for drip service on steam mains and steam supply lines, tracing, or for small process equipment. The 2-bolt Universal Connectors are commonly used in chemical plants, petrochemical refineries, paper mills, and other industrial facilities. The 2-bolt Universal Connectors are considered an industrial standard, making them compatible with other manufacturers' universal steam trap modules.

How It Works

The Test Trap Station permanently installed in the piping system. The convenient 2-bolt mounting system allows the trap module to be removed and replaced quickly and easily using a socket or open-end wrench without disturbing the existing piping. The handwheels control the integral piston-style inlet and outlet isolation valves while the test valve opens a port to visually inspect trap discharge and function. A strainer and blowdown valve are included to protect the trap module from fouling due to pipe scale and debris. Blowdown can also be used to reduce start-up times.

Features

- Universal connector with 2-bolt mounting allows for fast, easy replacement of trap module making it more cost-effective than replacing conventional type steam traps
- Integral piston-style valves allow for reliable isolation of trap module for testing and replacement of trap
- All stainless steel construction
- Trap module can rotate 360° on the universal connector allowing any orientation during installation
- Compatible with other manufacturers' trap modules
- Available with integral strainer and blowdown valve

Sample Specification

The Universal Connector Steam Trap Test Station shall be all stainless steel construction designed to ANSI/ASME B16.34 Class 600. The unit shall include a two-bolt 360 degree swivel mount flange design, piston-style isolation valves, test valve, and integral strainer and blowdown valve.

Installation and Maintenance

The universal connector can be installed in vertical or horizontal piping and available in 1/2", 3/4" and 1" threaded NPT, socket weld (SW), and flanged (FLG). In horizontal installations, orientation of connector body may be dependent on the specific type of trap module used. These connectors remain permanently installed in the piping system. The convenient 2-bolt mounting system allows the trap module to be easily replaced using a socket or open-end wrench without having to unthread piping. Pipe test port to safe location.

MATERIALS

Connector Body	Stainless Steel, ASTM A351 CF8M
Bonnet	Stainless Steel, ASTM A351 CF8M
Bonnet Studs	A193 Grade B7
Bonnet Nuts	A194 Grade 2H
Valve Stem & Piston	Stainless Steel, 416
Valve Rings	Graphite & Stainless Steel
Handwheel	Ductile Iron
Washers	Stainless Steel
Gasket	Copper
Strainer Screen	Stainless Steel, 304
Blowdown Body & Stem	Stainless Steel
Test Valve Body & Stem	Stainless Steel

Option

Internal Check Valve available; Consult factory..

How to Size / Order

Connectors and Trap Modules are ordered separately. See following pages for the Trap Modules.

UTS600 Series

Universal Style Quick-Change Trap Test Station

(For use with **Universal Quick-Change Trap Modules**)

Helpful Selection Information

Choose the desired style connector:

UTS600R (Flow to Right)

UTS600L (Flow to Left)

All connector styles will operate with any trap module. UTS600 Series Connectors include integral inlet and outlet isolation valves, strainer and blowdown valve on inlet side and test valve on outlet side.

Used with the following Watson McDaniel Steam Trap Modules:

USIB450	- Inverted Bucket
UTD450	- Thermodynamic
UTD450SM	- Thermodynamic
UTD600LSM	- Thermodynamic
UT450	- Thermostatic
UFT450	- Float & Thermostatic
UB450	- Bi-Metallic

Features of the Watson McDaniel Steam Test Trap Station

Testing steam traps is critical to prevent energy loss and maintain steam system safety. However, testing steam traps is often overlooked due to the tedious and sometimes difficult procedure to accurately assess a steam trap's operation.

The UTS600 Trap Test Station greatly simplifies the process of testing and maintaining a facility's steam trap population. By simply closing the Outlet Isolation Valve and opening the Test Valve, the condensate discharge is isolated from the Condensate Return Line and then routed through the Trap Test Port elbow to visually observe trap discharge. Visual inspection of a steam trap's discharge is the most accurate method of determining if a trap is functioning properly.

Steam Distribution Manifolds

SDM Series

Manifolds

Forged Carbon Steel with Integral Isolation Valves

Model	SDM Series
Sizes	1/2", 3/4"
Connections	NPT, SW, Tube Fitting
Body Material	Forged Carbon Steel
PMO Max. Operating Pressure	825 PSIG
Pressure/Temperature Rating	825 PSIG @ 800°F

Typical Applications

SDM Series manifolds are used for **STEAM DISTRIBUTION** TO the tracing system. Commonly used in chemical and petrochemical facilities as well as in other industrial plants that have multiple tracing applications. Manifolding the steam distribution system not only reduces installation and maintenance costs, but also streamlines and organizes piping. The SDM Series has integral isolation valves (option available without isolation valves).

Description

The SDM Series manifold is forged carbon steel with 4, 8, or 12 branch steam outlet connections with integral isolation valves. Available with a variety of end connections, including NPT or Socket-weld. The top steam inlet connection is either Butt-weld or Flanged. The bottom condensate outlet connection is available with optional gate valve. The manifold assembly is offered separately or with optional frame stand.

Installation & Maintenance

Securely install the manifold in a vertical orientation with steam inlet connection at the top. A drip station with appropriately sized steam trap mounted at the bottom condensate outlet connection is recommended. If optional frame is selected, make certain it rests on a stable base and secure as needed.

Sample Specification

The steam distribution manifold shall be forged carbon steel with branch options to accommodate up to 12 steam supply connections.

Features

- Compact design saves valuable plant space
- Complete with Material Traceability Reports (CMTRs)
- Available in 4, 8, & 12 branch designs
- Integral piston-style valves allow for tight shut-off and long service life
- All welding in accordance with Section IX of the ASME Boiler and Pressure Vessel Code
- Provides freeze protection
- Reduces installation and maintenance time
- Options include frame stands, drip steam traps, drain valves, insulation jackets, etc.

Typical Applications

CCM Series manifolds are used for **CONDENSATE COLLECTION FROM** the tracing system. Commonly used in chemical and petrochemical facilities as well as in other industrial plants that have multiple tracing applications. Manifolding the condensate collection system not only reduces installation and maintenance costs, but also streamlines and organizes piping.

Description

The CCM Series manifold is forged carbon steel with 4, 6, 8, 10, or 12 branch condensate inlet connections available with a variety of end connections, including NPT or Socket-weld. The top condensate outlet connection is either NPT, Butt-weld or Flanged. The bottom drain connection is available with optional gate valve. The manifold assembly is offered separately or with optional frame stand. **Model CCMS** condensate collection manifold is provided with a built-in siphon tube to minimize bi-phase flow, which reduces water hammer and helps control flash steam.

Installation & Maintenance

Securely install the manifold in a vertical orientation with condensate outlet connection at the top. Steam trap stations and a bottom drain valve are required, and available as options. If optional frame is selected, make certain it rests on a stable base and secure as needed.

Sample Specification

The condensate collection manifold shall be forged carbon steel with branch options to accommodate up to 12 connections. Model CCMS manifold shall include integral siphon tube for promoting single phase condensate discharge.

Features

- Compact design saves valuable plant space
- Complete with Material Traceability Reports (CMTRs)
- Available in 4, 6, 8, 10, & 12 branch designs
- Available with pre-assembled steam trap stations including isolation and test valves
- All welding in accordance with Section IX of the ASME Boiler and Pressure Vessel Code

Clean Steam Traps

Introduction

What is Clean Steam or Pure Steam?

Clean Steam is steam that is made from deionized or distilled water in specialty boilers or steam generators. It is typically used in pharmaceutical applications such as sterilizers, fermenters and bioreactors as well as in the food production industries, distilleries and hospitals. Clean Steam should be used on any process that utilizes steam in such a way that it may come into direct contact with the end product and cause contamination. Industrial grade steam (most common grade of steam) is unsuitable for direct product contact because it contains contaminants from boiler additives, rust, and other heat transfer equipment. Pure Steam is clean steam that is produced to be virtually free of pyrogens and endotoxins, and is defined as "Water For Injection" or WFI.

Materials of construction

The Ultra-Pure water that is used to make clean steam has been depleted of all of its ions during the purification process, making it very chemically aggressive to metals, or "ion hungry." Therefore, only corrosion resistant metals such as 316 Stainless Steel can be used in products that handle clean steam. It's often required that the Stainless Steel in contact with Clean Steam must be passivated, a chemical process that removes any residual surface iron and promotes Chrome Oxide formation, further improving corrosion resistance.

Surface Finish

Smoothing the surfaces by means of polishing reduces the ridges and crevices where micro-organisms (bacteria) may grow. While mechanical polishing will reduce the surface ridges significantly, electro-polishing is required to meet the standards of sanitary systems. Electro-polishing is an electro-chemical process that smoothes the surface of a metal object by removing surface metal ion by ion. Ra is measured in microinches and refers to the smoothness of a surface. The lower the Ra number, the smoother the surface and the less chance for surface contamination and microorganism growth.

Sanitary Steam Traps Vs. Clean Steam Traps

Steam traps to be installed in sanitary piping systems must adhere to stringent design standards beyond traps merely suitable for clean steam applications.

Sanitary Steam Traps are designed to offer free flow through internal passages by incorporating very smooth internal finishes. The internal electro-polish finish on a sanitary steam trap must be between 20-25 Ra while the external finish is usually between 25-32 Ra. Because the system must be periodically passivated to provide sterilization, these traps offer a sanitary tri-clamp connection on the body to allow for removal of the thermal element. Removal of the element allows unobstructed flow through the trap during passivation. The FDA300, FDA400 & FDA500 are Sanitary Steam Traps.

Clean Steam Traps are steam traps designed for the same functionality as the sanitary traps, but do not offer the same level of surface finish, RA. Therefore clean steam traps cannot be used when a sanitary specified application is required.

Clean-in-place (CIP) & Sterilization-in-place (SIP)

CIP is a system which allows the automatic cleaning and disinfecting of plant equipment without dismantling, using cleaning fluids such as detergents, acids, alkalis, and water. CIP uses a high flow, highly turbulent solution to remove soil in the system. Chemicals are used to break up and remove the remaining soil. Sanitizer is then used to kill remaining microorganisms.

SIP is the process of sterilizing plant equipment without dismantling, usually following CIP procedures. SIP uses low pressure steam for sterilization purposes – typically 30 – 35 psig. The steam trap bodies must be passivated to remove any residual iron deposits as well as to promote a chrome oxide layer to enhance corrosion resistance of the stainless steel.

Connections

Because different facilities may identify different areas of potential contamination in a piping system, various end connections are available to satisfy customer needs.

Sanitary Tri-Clamp - A quick disconnect type fitting that meets sanitary piping standards allowing piping systems or products to be easily dismantled.

Tube Weld (TW) – a connection offered where welding of the steam trap is preferred for sanitary applications

NPT – a standard national pipe thread taper connection offered for applications with less stringent requirements, often considered on main line drip applications

Manufacturing and Design Standards

ASME BPE – Provides requirements of equipment used in bioprocessing, pharmaceutical and other applications that require high hygienic levels.

USP 24 – Standard for Pharmaceutical Grade Water which specifies the chemical composition of the allowable number of contaminants.

FDA CFR Title 21-177.1550 – Standard for perfluoro-carbon resins that may be safely used as components intended to contact food.

3A Sanitary Standards – Standards provide material specifications, design criteria and other necessary information for equipment types to satisfy public health concerns where a high degree of sanitation is required.

High-Capacity Sanitary

Model	FDA300
Sizes	1 1/2"
Connections	Tri-Clamp
Body Material	Stainless Steel
PMO Max. Operating Pressure	90 PSIG
TMO Max. Operating Temperature	Saturated Steam Temperature
PMA Max. Allowable Pressure	145 PSIG up to 338°F
TMA Max. Allowable Temperature	350°F @ 132 PSIG

Typical Applications

PROCESS: FDA300 Series high-capacity thermostatic clean steam traps are used on clean steam applications, and for condensate drainage on CIP/SIP systems and various process vessels.

How It Works

This trap contains a welded 316L stainless steel thermal element that expands when heated and contracts when cooled. When air and subcooled condensate are present, the trap is in an open discharge position. When steam reaches the trap, the element expands, closing the trap tightly.

Features

- All wetted parts are 316L stainless steel
- Electro-polish finish of 20-25 microinches RA on internal surfaces of body
- Electro-polish finish of 25-32 microinches RA on external surfaces of body
- Operates close to saturation curve to minimize condensate back-up
- Completely self-draining in the vertical downward flow orientation

Sample Specification

The steam Trap shall be all 316L stainless steel thermostatic type with a balanced pressure bellows that operates close to saturated steam temperatures. Internal body parts shall have an electro-polish finish of 20-25 microinches RA internally and a 25-32 finish externally. The unit shall have a split-body sanitary clamp design for easy maintenance. Trap shall be completely self-draining when mounted vertically.

Installation and Maintenance

This trap is designed for installation in a vertical, downward flow orientation to ensure that the self-draining clean steam requirement is satisfied.

Options

Electropolish to 15 Ra internal or lower is available; Consult factory.

Steam Traps

Clean Steam Thermostatic Steam Trap

(Repairable)

FDA400
Thermostatic Clean Steam

Model	FDA401, FDA402, FDA403
Sizes	1/2", 3/4"
Connections	Tri-clamp
Body Material	Stainless Steel
PMO Max. Operating Pressure	90 PSIG
TMO Max. Operating Temperature	Saturated Steam Temperature
PMA Max. Allowable Pressure	145 PSIG up to 338°F
TMA Max. Allowable Temperature	350°F @ 132 PSIG

Material Traceability Reports (MTR) provided with all FDA400 Series Steam Traps.

Typical Applications

DRIP, PROCESS: FDA400 Series thermostatic clean steam traps are used in clean steam applications such as drainage for CIP/SIP systems and various process vessels. The universal horizontal connection allows the trap body to swivel to any angle. The FDA400 Series allows for a 90 degree connection either the inlet or outlet capable of 360 degree orientation.

How It Works

This trap contains a welded 316L stainless steel thermal element that expands when heated and contracts when cooled. When air and subcooled condensate are present, the trap is in an open discharge position. When steam reaches the trap, the element expands, closing the trap tightly.

Features

- Universal horizontal connection swivels to any angle
- All wetted parts are 316L stainless steel
- Electro-polish finish of 20-25 microinches RA on internal surfaces of body
- Electro-polish finish of 25-32 microinches RA on external surfaces of body
- Operates close to saturation curve to minimize condensate back-up
- Completely self-draining in the vertical downward flow orientation

Sample Specification

The Steam Trap shall be all 316L stainless steel thermostatic type with a balanced pressure bellows that operates close to saturated steam temperatures. Inlet, outlet or both connections must contain a 90° swivel arrangement capable of 360° orientation. Internal body parts shall have an electro-polish finish of 20-25 microinches RA internally and a 25-32 finish externally. The unit shall have a split-body sanitary clamp design for easy maintenance. Trap shall be completely self-draining when mounted vertically.

Installation and Maintenance

Trap is designed for installation in a vertical, downward flow orientation to ensure that the self-draining clean steam requirement is satisfied.

PMA Max. Allowable Pressure	145 PSIG up to 338°F
TMA Max. Allowable Temperature	350°F @ 132 PSIG

Material Traceability Reports (MTR) provided with all FDA500 Series Steam Traps.

Typical Applications

DRIP, PROCESS: FDA500 Series thermostatic clean steam traps are used in clean steam applications as drip traps on piping runs as well as for drainage for CIP/SIP systems and various process vessels.

How It Works

This trap contains a welded 316L stainless steel thermal element that expands when heated and contracts when cooled. When air and subcooled condensate are present, the trap is in an open discharge position. When steam reaches the trap, the element expands, closing the trap tightly.

Features

- All wetted parts are 316L stainless steel
- Electro-polish finish of 20-25 microinches RA on **internal** surfaces of body. Consult factory for 15RA max surface finish option.
- Electro-polish finish of 25-32 microinches RA on **external** surfaces of body
- Operates close to saturation curve to minimize condensate back-up
- Completely self-draining in the vertical downward flow orientation

Sample Specification

The steam Trap shall be all 316L stainless steel thermostatic type with a balanced pressure bellows that operates close to saturated steam temperatures. Internal body parts shall have an electro-polish finish of 20-25 microinches RA internally and a 25-32 finish externally. The unit shall have a split-body sanitary clamp design for easy maintenance. Trap shall be completely self-draining when mounted vertically.

Installation and Maintenance

This trap is designed for installation in a vertical, downward flow orientation to ensure that the self-draining clean steam requirement is satisfied. If purchased with tube weld connections with the intention of welding in-line, the thermal element and gasket must be removed during the welding process or heat damage may occur.

Typical Applications

DRIP: The **FDA800 Series** thermodynamic clean steam traps are used as drip traps on steam mains in CIP/SIP systems and drainage for separators and filters.

How It Works

Using the thermodynamic properties of flash steam, this trap features a disc that is pushed open by incoming condensate, then closes tightly when steam enters the trap. Because it normally operates in an open position, condensate is continuously discharged from the line. Steam entering the trap creates an internal pressure that forces the valve to close tightly, preventing the steam from escaping.

Features

- Small and compact
- All 316L stainless steel components
- Works in any position (horizontal preferred)

Sample Specification

The steam trap shall be a thermodynamic disc type with an all 316L stainless steel construction and integral seat design. Unit shall be capable of installation in any orientation and self-draining when mounted vertically.

Installation and Maintenance

Can be installed in any position; however, horizontal is preferred. For self-draining requirements, the trap should be installed vertically. Installation should include a strainer before the trap inlet since dirt is a common cause of premature failure.

Notes

Condensate Pumps

Condensate Return System

Shown below is a simplified view of a steam system from steam generation to condensate return. Steam generated by the boiler travels through the steam distribution lines supplying steam to various pieces of process equipment. The steam flowing to this equipment is separated from the condensate return lines by steam traps.

Relatively small steam traps, referred to as “Drip traps,” are used for optimization and protection of steam systems by draining condensate from steam distribution lines into the condensate return line.

Process Applications refer to draining condensate from the actual process using the steam into the condensate return line. The steam traps used in these applications have relatively high condensate capacity and are referred to as “Process traps”.

A large plant may have many separate pieces of process equipment and thousands of drip traps discharging condensate into the condensate return lines. On efficiently run steam systems, this condensate is returned back to the boiler for reuse.

Steam Distribution & Condensate Return System

What are Condensate Return Pumps & when are they required?

In certain cases, the steam pressure of the system may be sufficient to push the condensate through the steam traps and condensate return lines, back to the condensate holding tank in the boiler room. In most practical situations, however, one or more condensate return pumps are required to assist in overcoming gravity, pressure drops from long piping runs, and back pressures in return lines. Condensate Return Pumps are either electrically-driven centrifugal pumps or non-electric mechanical pumps that use steam pressure as the motive force to pump the condensate. Non-electric pumps are referred to as Pressure Motive Pumps (PMPs).

What is a Boiler Feed Pump? A facility will often have a separate area that contains various components required for the generation of steam, such as a boiler, condensate holding or deaerator (DA) tank, boiler feed pump, water treatment, etc. Regulated by the boiler control system, the boiler feed pump sends condensate from the holding tank back to the boiler.

Introduction

What are Pressure Motive Pumps (PMPs)?

Pressure Motive Pumps (PMPs) are non-electric pumps which return condensate back to the boiler room; using steam pressure as the motive force. PMPs can be supplied as stand-alone units – which include a pump tank, the internal operating mechanism, and a set of inlet and outlet check valves, or: as a packaged system – which also includes the vented receiver tank (to collect the condensate) mounted on a common base.

What is the purpose of a Vented Receiver?

Condensate from several different sources, at different pressures, are often discharging into the same return line. The discharge from one of the higher pressure sources could easily increase the pressure in the return line, which would stop the discharge from a critical process application operating at lower pressures.

By connecting the condensate return line to a vented receiver, the pressure in the return line will be effectively equalized to atmospheric pressure, allowing condensate to freely drain from all condensate sources. This is an extremely important and often overlooked aspect of any properly operating steam and condensate return system. The receiver and vent must be adequately sized to allow for the discharge of flash steam without building up excessive pressure. Higher condensate pressures or loads would require larger receiver and vent sizes. Condensate then flows by gravity from the vented receiver to the condensate return pump and is then returned back to the boiler room.

Mechanical & Electric Condensate Return Pumps

Mechanical stand-alone Pressure Motive Pumps (PMPs)

A stand-alone Pressure Motive Pump (PMP) consists of a pump tank with internal operating mechanism, and a set of inlet and outlet check valves. Pump tanks can be made from ductile iron (PMPC), fabricated steel (PMPF) or stainless steel (PMPSS). A PMP requires some form of a separate vented receiver tank that collects the condensate prior to entering the pump. This vented receiver is required to neutralize the pressure in the condensate return line by venting the flash steam to the atmosphere.

Pumps with Receiver Tanks (Standard Skid Systems)

Simplex, Duplex, and Triplex packaged systems include stand alone pumps and check valves with a vented receiver tank, mounted on a steel base and frame. Multiple pumping units can be used for increased capacity or for system redundancy. The stand-alone pumps are available in ductile iron, carbon steel and stainless steel; options include sight glasses, insulation jackets, cycle counters, motive and vent piping, pressure regulators, steam traps, strainers and ASME code stamp. All components of the system are properly sized and pre-piped together; requiring only four connections to be made in the field.

Electric Pumps

Electric Condensate Return Pumps are designed to work intermittently, discharging condensate only when the receiver tank is nearly full. This is accomplished with a float switch. A float connected to the switch assembly rises when condensate enters the tank. Once it rises above a set point, the switch energizes the motor on the pump, which runs until the water level drops below the bottom position of the float switch. The switch then de-energizes the motor to shut off the pump. Watson McDaniel electric pumps are offered in Simplex and Duplex models.

Note: The integral receiver tank for electric condensate pumps is not designed to be a flash tank. A separate vented receiver may be required depending on condensate pressure, temperature, and piping.

Why choose a PMP instead of an electric (centrifugal) condensate return pump?

Reliability is the primary purpose for selecting Mechanical type PMP's instead of Electric condensate pumps.

Electric pumps require a mechanical seal to prevent the leakage of liquid around the rotating shaft that drives the impeller. The liquid being pumped acts as a lubricant so the seal faces of the mechanical seal may rotate freely against each other. When the liquid remains relatively cool, the mechanical seal could last for many years. However, hot condensate can flash to steam between the seal faces leading to seal failure.

A centrifugal pump creates a low pressure zone at the eye of the impeller which draws the fluid into the pump. Hot condensate can flash into steam in the low pressure zone causing Cavitation. Cavitation happens when bubbles form in the liquid on the inlet side of the pump that will re-compress on the outlet side, causing erosion of the impeller and pump housing. When a pump cavitates, it often sounds like marbles or sand is being pumped. This flashing also blocks the flow of incoming condensate; causing the pump to run dry which decreases performance and also leads to seal failure.

1) PMP's do not have any seals to fail.

2) No cavitation can occur because the body of the pump is filled by the natural flow due to gravity from a vented receiver, and then discharged by steam pressure.

Therefore, Pressure Motive pumps are much more forgiving than centrifugal pumps when pumping hot condensate.

Installation of mechanical type PMP's vs. Electric pumps:

Standard **Electric Pumps** are supplied with a receiver tank and are intended for lower pressure steam systems. In these instances, the vent size on the receiver tank should be adequate to vent minimal flash steam, allowing condensate to freely enter the receiver and to adequately cool prior to being pumped. In higher pressure steam systems, the condensate temperature is hotter, resulting in more flash steam as the condensate is discharged through steam traps and into the return line. Additional options may be required for the electric pumps if condensate does not cool to suitable temperatures.

PMPs discharge high temperature condensate that drains from vented receivers. A **stand-alone PMP** pump tank cannot be used as the vented receiver since it is intermittently pressurized with steam or air to pump the condensate. PMPs require a separate vented receiver to collect the condensate and to vent the flash steam to atmosphere. The Simplex, Duplex or Triplex packaged systems include the separate vented receiver tank mounted on a common base along with the PMP(s).

Vented Receivers should generally be sized to maintain 0 psig in both the receiver and condensate return line upstream of the receiver. This helps ensure free drainage of condensate from sources that may be operating at both high and low pressure. Sizing criteria is based on condensate pressure and the amount of the flash steam created. Undersizing the receiver or the vent will increase the pressure in the receiver and condensate return line, possibly causing issues with condensate drainage from process equipment upstream. Undersizing of the vent will increase the velocity of flash steam in the pipe which could possibly draw condensate from the receiver and discharge it out of the vent.

Pump (PMP) with a Vented Receiver

A Vented Receiver (or Flash Tank) is used to collect the condensate generated from one or several different sources (drip & process applications) in the facility.

Pressure from the Flash steam generated by the hot condensate is vented to the atmosphere to maintain atmospheric pressure (0 PSIG) in the receiver tank. This assures that condensate will freely flow by gravity to the receiver tank and then to the pump tank, avoiding potential condensate back-up.

Introduction • Applications for using PMPs

Operation of PMP Pressure Motive Pump

Vent Outlet: Open position, allowing any pressure in the pump tank to vent out and water to freely enter pump by gravity.

Motive Inlet: Closed position

Pump Filling

Condensate level rising

- 1 Condensate flows from the receiver tank through the inlet check valve and fills the pump tank. During the filling cycle the float inside the tank rises.

Vent Outlet: Closed

Motive Inlet: Open; steam pressure enters tank and discharges condensate

Pump Discharging

Condensate level falling

- 2 When the pump tank has filled to the trip point, the mechanism triggers, opening the motive gas inlet valve and simultaneously closing the vent valve. This allows motive pressure to enter the pump body, which drives the condensate thru the outlet check valve into the condensate return line. During the discharge cycle, the liquid level and the float inside the pump tank drop.

Vent Outlet: Open position, allowing any pressure in the pump tank to vent out and water to freely enter pump by gravity.

Motive Inlet: Closed Position

Pump Filling

Condensate level rising

- 3 At the lower trip point, the mechanism triggers and the motive gas inlet valve to the pump tank closes and simultaneously the vent valve opens. The fill and discharge cycle then repeats.

The positions of the **Vent** and **Motive** valves control the filling and discharge of the pump. The Vent valve must be open during the filling cycle to allow air or steam in the pump tank to be displaced as water enters the pump. Since water flows into the pump tank by force of gravity, the pump tank pressure must be neutralized for the pump tank to fill.

When the pump tank reaches its fill point the vent valve closes and the motive valve opens. The incoming steam pressure rapidly forces the water out of the pump tank through the outlet check valve. When the pump tank empties, the vent valve opens and motive inlet valve closes.

Check Valves

The inlet check valve on the PMP system must have a very low cracking pressure (opening pressure) so that the liquid will freely enter the pump tank. The proper check valve is very critical to the proper operation of the PMP system. Watson McDaniel recommends using spring-loaded stainless steel check valves with 1/4 PSI cracking pressure.

A Swing-style Quick-Fill check valve is available for extremely low-fill head applications to increase the fill rate of the pump (1 1/2" only).

The Internal Working Mechanism

The heart of the PMP is the internal working mechanism, which features the **Patented SNAP-ASSURE™** Design. This feature, exclusive to Watson McDaniel's PMPs, **Guarantees to extend pump life** even in the most demanding applications.

The environment inside a pump tank can be extremely harsh and volatile. Hot condensate can be very aggressive and may even corrode stainless steel springs when they are under tension or compression (high stress). This is known as stress corrosion-cracking. Additionally, condensate systems normally contain fine particles of rust and other contaminants, such as pipe scale, further aggravating mechanical components. The Watson McDaniel Pump Mechanism has been refined and developed over many years and has proven itself in its performance and reliability.

Internal Mechanism Features

- Equipped with Watson McDaniel's patented "Snap-Assure" feature, which extends the useful life of the pump by assuring that the internal toggle action triggers at every fill and discharge cycle
- All Stainless Steel components minimize corrosion (spring material is Inconel-X-750)
- Hard chrome-plated pivot pins and wear points substantially reduce the rate of wear on critical components
- 17-4 heat-treated stainless steel inlet and vent valve (Hardened seats have proven themselves to last years)
- Dual-compression springs, made from Inconel-X-750, eliminate the effects of stress corrosion-cracking and are designed to last indefinitely
- Precision manufactured mechanisms never require field adjustments
- Watson McDaniel "Snap-Assure" mechanisms can be purchased separately and will fit other manufacturers' pump tanks (minimum 19.25" activation length required when using standard PMPC or PMPF mechanisms. Contact factory for other mechanism retrofits.)

Snap-Assure Pump Mechanism

- 1) Cover & mechanism bolt to top of pump tank.
- 2) Mechanism is field-repairable by replacing any of the functioning components such as springs and valve seats.
- 3) Mechanism can fit other manufacturers' pump tanks (minimum 19.25" activation length required when using standard PMPC or PMPF mechanisms. Contact factory for other mechanism retrofits.)

Check Valves

The inlet check valve on the PMP system must have a very low cracking pressure (opening pressure) so that the liquid will freely enter the pump tank. The proper check valve is very critical to the proper operation of the PMP system. Watson McDaniel recommends using spring-loaded stainless steel check valves with 1/4 PSI cracking pressure.

A **Quick-Fill Swing-Style Check Valve** is available. Use for extremely low fill head applications to increase fill rate of pump. (1 1/2" only).

Mechanical Condensate Return Pumps are available as:

- 1) PMP (Pressure Motive Pump - Stand-Alone Unit) or
- 2) Pump System (Pumps with Vented Receiver Tanks):

Mechanical PMP Stand-Alone Pumps

Watson McDaniel's **Pressure Motive Pump (PMP)** stand-alone unit consists of the pump tank, which is made from ductile iron, fabricated steel, or stainless steel, and Watson McDaniel's patented "Snap-Assure" internal operating mechanism, along with a set of inlet and outlet check valves. An additional vented receiver or flash tank is required to collect the condensate before it enters the pump.

Watson McDaniel offers a full line of PMP accessories, including custom tanks, insulation jackets, gauge glasses, cycle counters, pre-piped accessories, pump mechanisms, check valves and anything else you may need to maintain your system.

Several choices of pump body materials, types and configurations are available to meet specific customer applications:

Ductile Iron Pump Tanks

Ductile Iron is far superior to cast iron in handling higher pressures and temperatures. Ductile iron is also extremely corrosion resistant to condensate and water and can last in excess of 50 years before tank replacement is required. Our ductile iron tanks can be ASME coded on request.

Fabricated Carbon Steel Pump Tanks

Carbon steel tanks are required in certain industrial facilities such as chemical and petrochemical refineries. However, fabricated cast steel is much less corrosion-resistant to condensate than ductile iron. Our carbon steel tanks are standard ASME coded.

Fabricated Stainless Steel Pump Tanks

Stainless steel (304L) tanks are extremely corrosion-resistant, giving increased longevity and can serve as a substitute for fabricated carbon steel tanks.

Low Profile Pump Tanks

Low-profile tanks are required when vertical space for adequate filling head of the pump is limited.

Stand-Alone Units - Pressure Motive Pumps

PMPC
Cast Ductile Iron

Significantly more corrosion-resistant to condensate when compared to carbon steel.

PMPF
Fabricated Carbon Steel

Carbon Steel may be required by code in Chemical and Petro-Chemical industries (required in certain industries).

PMPSS
316L Stainless Steel
(Corrosion Resistant)

Can serve as a substitute for fabricated carbon steel tanks for extended life or when Stainless Steel is required.

PMPLS
Fabricated Carbon Steel
(Reduced-Profile)

Lower in height than PMPF. Required when vertical space for adequate filling head of the pump is limited.

PMPBP
Carbon Steel
(High-Capacity)

For applications requiring large transfer rates of condensate or other liquids.

PMPNT
Ductile Iron or Stainless Steel
(Low-Profile)

For lower capacity applications.

PMPSP Sump Drainer (non-electric sump pump)

Sump drainers are used to pump water from pits or sumps using steam or air pressure. They are similar to the standard PMP models except that they discharge vertically upwards. This piping configuration allows them to be lowered into a sump or pit.

Pump Systems (Pumps with Receiver Tanks)

The **PMPC**, **PMPF** & **PMPLS** pump units are also available with a Vented Receiver mounted on a common base. The vented receiver is needed to collect the condensate which then drains by gravity into the pump tank. These standard **Simplex**, **Duplex** and **Triplex** packaged systems include stand-alone pump(s) and check valves with a vented receiver tank mounted on a steel base and frame. Multiple pumping units can be used for increased capacity or for system redundancy. The pump units are available in ductile iron (**PMPC**) or carbon steel (**PMPF**). Additional options include sight glasses, insulation jackets, cycle counters, motive and vent piping, pressure regulators, steam traps, strainers, ASME code stamps, etc.

Simplex Pumping System (shown)

Single pump with receiver tank mounted on a common base.

Duplex Pumping System (shown)

More than one pump can be used for increased capacity or system redundancy.

Stand-Alone Pumps

CAST DUCTILE IRON TANK

PMPC

Pressure Motive Pump

Condensate
Pumps

Model	PMPC
Body	Ductile Iron
Cover	Ductile Iron
Check Valves	Stainless Steel
PMO Max. Operating Pressure	200 PSIG
TMO Max. Operating Temperature	388°F
PMA Max. Allowable Pressure	200 PSIG @ 650°F
TMA Max. Allowable Temperature	650°F @ 200 PSIG

Typical Applications

The **PMPC** model **Ductile Iron** non-electric pressure motive pump is typically used when liquids must be moved to higher elevation, higher pressure or extended distances. This stand-alone pump is capable of operating with a maximum motive pressure of 200 PSIG provided by steam, air or other gas supply. **ASME "UM" code stamp is available.**

Features

- Equipped with our **Patented "Snap-Assure" Mechanism** which **extends the useful life of the pump**
- Mechanism incorporates **heat-treated stainless steel wear items**
- All stainless steel internals for ultimate corrosion resistance
- Dual compression springs made from Inconel-X-750 for high-temperature corrosive service
- Operates using steam, air, nitrogen or other pressurized gases as the motive force
- Non-Electric** – can be used in remote locations or NEMA 4, 7, 9 and hazardous areas

Sample Specification

The non-electric pressure powered pump shall be capable of operating with a maximum motive pressure of 200 PSIG provided by steam, air or other gas supply. The pump body shall be cast ASTM A-395 Ductile Iron capable of an ASME "UM" code stamp if requested. The pump mechanism shall be float operated with a patented "Snap-Assure" feature constructed of all stainless steel materials with all load bearing points hardened for extended service life. The mechanism shall feature two Inconel springs used in compression with motive & vent valves hardened to 40c Rockwell.

Operating Specifications

Pump discharge per cycle: 8.4 gallons
Average instantaneous discharge rate: 90 gpm
Average steam consumption: 3 lbs. per 1000 lbs. liquid pumped
Average air consumption: 60 SCF per 1000 lbs. pumped

Check Valves	Stainless Steel
PMO Max. Operating Pressure	200 PSIG
TMO Max. Operating Temperature	388°F
PMA Max. Allowable Pressure	250 PSIG @ 650°F

Typical Applications

The **PMPF** model **Carbon Steel** non-electric pressure motive pump is typically used when liquids must be moved to higher elevation, higher pressure or extended distances. This stand-alone pump is capable of operating with a maximum motive pressure of 200 PSIG provided by steam, air or other gas supply. These tanks are fabricated with 0.025" corrosion allowance and receive the ASME "UM" code stamp.

Features

- Equipped with our **Patented "Snap-Assure" Mechanism** which **extends the useful life of the pump**
- Mechanism incorporates **heat-treated stainless steel wear items**
- All stainless steel internals for ultimate corrosion resistance
- Dual compression springs made from Inconel-X-750 for high-temperature corrosive service
- Operates using steam, air, nitrogen or other pressurized gases as the motive force
- Non-Electric** – can be used in remote locations or NEMA 4, 7, 9 and hazardous areas

Sample Specification

The non-electric pressure powered pump shall be capable of operating with a maximum motive pressure of 200 PSIG provided by steam, air or other gas supply. The pump body shall be fabricated carbon steel and certified with the ASME "UM" code stamp. The pump mechanism shall be float operated with a patented "Snap-Assure" feature constructed of all stainless steel materials with all load bearing points hardened for extended service life. The mechanism shall feature two Inconel springs used in compression with motive & vent valves hardened to 40c Rockwell.

Stand-Alone Pumps

CARBON STEEL LOW-PROFILE TANK

PMPLS
Pressure Motive Pump

Condensate
Pumps

Model	PMPLS
Body	Carbon Steel
Cover	Carbon Steel
Check Valves	Stainless Steel
PMO Max. Operating Pressure	150 PSIG
TMO Max. Operating Temperature	366°F
PMA Max. Allowable Pressure	150 PSIG @ 650°F

Note: Optional 200 PSIG PMA/PMO. Consult Factory.

Typical Applications

The **PMPLS** model **Carbon Steel** non-electric pressure motive pump is a lower profile than the standard PMPF model. It is sometimes required when draining condensate from process equipment that is positioned close to the ground, which limits the filling head of the pump. This stand-alone pump is capable of operating with a maximum motive pressure of 150 PSIG provided by steam, air or other gas supply. These pumps receive the ASME "UM" code stamp.

Features

- Equipped with our **Patented "Snap-Assure" Mechanism** which **extends the useful life of the pump**
- Mechanism incorporates **heat-treated stainless steel wear items**
- All stainless steel internals for ultimate corrosion resistance
- Dual compression springs made from Inconel-X-750 for high-temperature corrosive service
- Operates using steam, air, nitrogen or other pressurized gases as the motive force
- Non-Electric** – can be used in remote locations or NEMA 4, 7, 9 and hazardous areas

Sample Specification

The non-electric pressure powered pump shall be capable of operating with a maximum motive pressure of 150 PSIG provided by steam, air or other gas supply. The pump body shall be fabricated carbon steel and certified with the ASME "UM" code stamp. The pump mechanism shall be float operated with a patented "Snap-Assure" feature constructed of all stainless steel materials with all load bearing points hardened for extended service life. The mechanism shall feature two Inconel springs used in compression with motive and vent valves hardened to 40c Rockwell.

PMA Max. Allowable Pressure	150 PSIG @ 450°F	150 PSIG @ 450°F

Typical Applications

The **PMPNT(S)** non-electric pressure motive pumps are light in weight and have an extremely low-profile. This stand-alone pump is capable of operating with a maximum motive pressure of 125 PSIG provided by steam, air or other gas supply. ASME Code Stamp available upon request.

Features

- Equipped with our proven, **Patented "Snap-Assure"** mechanism which **extends the useful life of the pump**
- Internal mechanism can be removed from the top of the pump while pump remains piped in line
- Mechanism incorporates **heat-treated stainless steel wear items** for ultimate corrosion resistance
- Dual compression springs made from Inconel-X-750 for high-temperature, corrosive service
- Non-Electric** – can be used in remote locations or NEMA 4, 7, 9 and hazardous areas
- Operates using steam, air, nitrogen or other pressurized gas as the motive force

Stand-Alone Pumps

CARBON STEEL HIGH-CAPACITY TANK

PMPBP
Pressure Motive Pump

Model	PMPBP
Body	Carbon Steel
Cover	Carbon Steel
Check Valves	Stainless Steel & Steel
PMO Max. Operating Pressure	150 PSIG
TMO Max. Operating Temperature	366°F
PMA Max. Allowable Pressure	150 PSIG @ 470°F

Condensate
Pumps

Typical Applications

The **PMPBP** model non-electric **Carbon Steel** pressure motive pump is extremely high-capacity for applications requiring large transfer of condensate or other liquids. This stand-alone pump is capable of operating with a maximum motive pressure of 150 PSIG provided by steam, air, nitrogen or other pressurized gases as the motive force. ASME "U" Code Stamp available upon request.

Features

- All stainless steel internals for ultimate corrosion resistance
- Operates using steam, air, nitrogen or other pressurized gas as the motive force
- **Non-Electric** – can be used in remote locations or NEMA 4, 7, 9 and hazardous areas

Options

- Cycle counter for measuring the amount of condensate flow through the pump.
- Insulation jackets are available to stop heat losses through the pump body.
- Sight glass for monitoring liquid level inside pump body.

Note: For applications where back pressure exceeds 50 PSIG, a High-BP mechanism is available; consult factory.

PMO Max. Operating Pressure	150 PSIG	125 PSIG
TMO Max. Operating Temperature	366°F	353°F
PMA Max. Allowable Pressure	150 PSIG @450°F	150 PSIG @450°F

Typical Applications

The **PMPSP** Sump Drainer uses the same internal mechanism as the standard PMP models. The piping configuration is such that the liquid is discharged vertically out the top as opposed to horizontally out the side. This allows the unit to be easily positioned inside of a sump area. Condensate or water from the sump enters the tank through a stainless steel low resistance check valve. This unit is capable of operating with a maximum motive pressure of 150 PSIG using steam, air, nitrogen or other pressurized gas as the motive force.

Features

- Equipped with our **Patented "Snap-Assure"** Mechanism which **extends the useful life of the pump**
- Mechanism incorporates **heat-treated stainless steel wear items** for ultimate corrosion resistance
- Dual compression springs made from Inconel-X-750 for high-temperature corrosive service
- Operates using steam, air, nitrogen or other pressurized gas as the motive force
- **Non-Electric** – can be used in remote locations or NEMA 4, 7, 9 and hazardous areas
- Built-in Strainer screen

Simplex
System

Typical Applications

Condensate Return Pressure Motive Pump (PMPs) with a Vented Receiver. Standardized Simplex, Duplex, Triplex, and Quadraplex packaged systems include stand-alone pump(s), check valves and vented receiver, mounted on a steel base and frame. Multiple pumping units can be used for increased capacity or for system redundancy. The PMP units are available in ductile iron, carbon steel and stainless steel. Additional options include sight glasses, insulation jackets, cycle counters, motive and vent piping, pressure regulators, steam traps, strainers, ASME code stamps, etc.

Sample Specifications

Unit shall be a Watson McDaniel, pre-packaged system to include pressure motive pump(s) with stainless steel check valves, an ASME vented receiver with "UM" code stamp, and interconnecting piping including inlet isolation valve. The carbon steel PMPF shall receive an ASME "UM" code stamp and the ductile iron PMPC shall offer it as an option. The pump mechanism shall be float operated with a patented "Snap-Assure" feature constructed of all stainless steel materials with all load bearing points hardened for extended service life, with no external seals or packing.

Inlet x Outlet refers to the size of the Inlet and Outlet Check Valves; not the Condensate Inlet Connection Size

SIMPLEX Systems

**ASME
Certified**

Features

- PMP pump systems reduce installation costs. Only 4 pipe connections are required in the field
- Watson McDaniel ensures that vented receivers and other components are properly sized for optimum system performance
- Watson McDaniel's fully-qualified fabrication facility is ASME code certified. Our engineers can design and build complete custom systems to meet all your requirements

Options

- Gauge glass assembly
- Cycle counter
- Insulation covers
- Motive steam drip trap (or liquid drainer for air)
- Overflow pipe connection
- Pressure regulator for motive supply line
- PMP vent line

PMO Max. Operating Pressure	125 PSIG
TMO Max. Operating Temperature	353°F
PMA Max. Allowable Pressure	150 PSIG @ 450°F
Receiver Pressure Rating	150 PSIG @ 566°F

Typical Applications

Condensate Return Pressure Motive Pump (PMPs) with a Vented Receiver. Standardized Simplex, Duplex, Triplex, and Quadraplex packaged systems include stand-alone pump(s), check valves and vented receiver, mounted on a steel base and frame. Multiple pumping units can be used for increased capacity or for system redundancy. The PMP units are available in ductile iron, carbon steel and stainless steel. Additional options include sight glasses, insulation jackets, cycle counters, motive and vent piping, pressure regulators, steam traps, strainers, ASME code stamps, etc.

Sample Specifications

Unit shall be a Watson McDaniel, pre-packaged system to include pressure motive pump(s) with stainless steel check valves, an ASME vented receiver with "UM" code stamp, and interconnecting piping including inlet isolation valve. The carbon steel PMPF shall receive an ASME "UM" code stamp and the ductile iron PMPC shall offer it as an option. The pump mechanism shall be float operated with a patented "Snap-Assure" feature constructed of all stainless steel materials with all load bearing points hardened for extended service life, with no external seals or packing.

INLET: Refers to Size of Inlet Check Valve, not Condensate Inlet connection size.

Check Valve NPT Inlet x Outlet	Model Code	Receiver Size
Simplex Systems - One Pump with Receiver (8" Fill Head)		
1" x 1"	S-PMPNT-1X1-SS-3x36	3" x 36"
1 1/2" x 1 1/2"	S-PMPNT-1.5X1.5-SS-3X36	3" x 36"
1 1/2" x 1 1/2"	S-PMPNT-1X1-SS-4x36	4" x 36"
1 1/2" x 1 1/2"	S-PMPNT-1.5X1.5-SS-4X36	4" x 36"
1 1/2" x 1 1/2"	S-PMPNT-1X1-SS-6x36	6" x 36"
1 1/2" x 1 1/2"	S-PMPNT-1.5X1.5-SS-6X36	6" x 36"

SIMPLEX Systems

Note: Duplex and Triplex Systems available; Consult factory.

Sizing & Selection

Sizing and Selecting a PMP

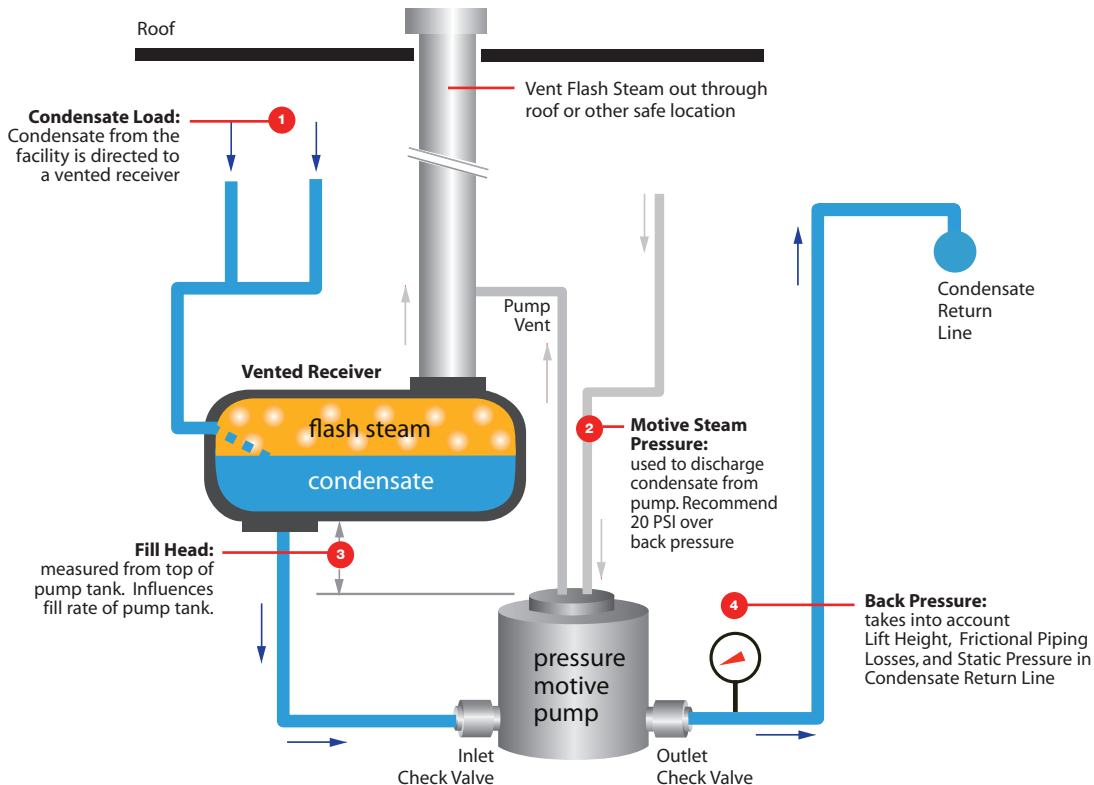

The Capacity Charts cover both Stand Alone Pumps (PMPC, PMPF, PMPLS, etc.) as well as Pumps with Receiver Tanks (Simplex, Duplex, Triplex). If a stand alone pump is chosen, consideration should be given to the size of the vented receiver that collects the condensate before the PMP (see flash tank vent sizing). If the pump is replacing an existing installation, a vented receiver that is acceptable in size and configuration may already be installed. If required to meet capacity, pre-packaged systems with more than one pump, such as the Duplex or Triplex are available. These units come pre-mounted with the pump(s), a receiver tank as well as other options to optimize the system. A multiple pump unit may also be chosen for reserve capacity or pump redundancy in critical applications.

To select the proper size pressure motive pump requires you to know a few key pieces of information:

- 1 Condensate load you need to pump:** Condensate Load is normally expressed in lbs/hr. To convert to GPM flow rate, note that 500 lbs/hr is equivalent to 1 GPM.
- 2 Motive Pressure:** The motive pressure of the steam (or other gas) impacts pump capacity. The sizing chart indicates different flow rates based upon motive steam inlet pressure. It is recommended to regulate the steam inlet pressure to 20 psi above the total back pressure.
- 3 Fill head:** Is the height (in inches) of the condensate receiver tank (or flash tank) above the pump tank. This head pressure determines how quickly the pump tank will refill with condensate after its discharge cycle. Therefore, reducing the fill time will increase the overall capacity of the pump. The capacity chart is based on 12" of fill head (PMPLS based on 6" fill head). Increasing fill head height can increase capacity by as much as 20 - 50%. (See Capacity Correction Chart.)
- 4 Back Pressure:** Back Pressure is the sum total of condensate return line pressure and the physical height that the condensate needs to be elevated. (See sizing section for guidance on how to calculate back pressure.)

Inlet x Outlet Size:

In addition to body material, pumps are designated by inlet and outlet size. For example, PMPC 3 x 2 has 3" inlet and 2" outlet check valves with a ductile iron tank. Since the pump fills by gravity from the receiver tank located above it, the size of the inlet check valve significantly impacts pump capacity. The larger the check valve, the quicker the condensate will fill the pump tank, allowing it to cycle again. For example, a 3" check valve may have twice the inlet flow rate of a 2" check valve. The size of the outlet (or discharge) check valve also affects capacity but to a lesser extent.

Stand Alone Pumps & Systems

Capacity based on 12" Fill Head except as noted

Condensate Pumps

CAPACITIES – Condensate (lbs/hr) Using steam as a motive pressure

* PMPSS is rated to only 150 PSIG.

Note: For PMPNT capacity, refer to PMPNT specification page.

Note for PMPBP only: For shaded values above 50 PSI back pressure, a high-BP mechanism is required; Consult factory.

Capacity Correction Factors for Alternate Filling Heads								
Pump Inlet Size	Filling Head							
	0"	6"	12"	18"	24"	36"	48"	60"
1"	0.70	1.00	1.10	1.20	1.30	1.50		
1 1/2"	0.62	0.70	1.00	1.10	1.20	1.35		
2"	0.62	0.70	1.00	1.10	1.20	1.35		
3"	0.70	0.84	1.00	1.04	1.08	1.20		
4"				0.80	1.00	1.10	1.15	1.20

NOTE: When the filling head differs from the standard filling height, the capacity of the pressure power pumps are either increased or decreased. For example, a pump with a 3" inlet that has a filling head of 36" as opposed to a standard filling head of 12", will have a capacity increase of 20%. Multiply the value found in the Capacity Table above by 1.2.

Capacity Correction Factors for Gas as Motive Pressure										
Pump Inlet Size	% Back Pressure relative to Motive Pressure									
	10%	20%	30%	40%	50%	60%	70%	80%	90%	
1"	1.00	1.13	1.16	1.20	1.25	1.30	1.35	1.40	1.45	
1 1/2"	1.04	1.06	1.08	1.10	1.12	1.15	1.18	1.23	1.28	
2"	1.04	1.06	1.08	1.10	1.12	1.15	1.18	1.23	1.28	
3"	1.04	1.06	1.08	1.10	1.12	1.15	1.18	1.23	1.28	
4"	No Capacity Change									

Note: For low specific gravity applications, consult factory.

Sizing & Selection

Vented Receiver (Open-Loop System)

Pump Size

The models of a Pressure Motive Pump are designated by the size of the inlet and outlet check valves (for example, a 3" x 2" PMPC or PMPF has a 3" Inlet check valve and a 2" outlet check valve). The larger the check valves, the larger the pump capacity.

STAND-ALONE PUMPS include pump tank, internal pumping mechanism, and check valves.

PUMP(S) WITH RECEIVER TANKS includes stand-alone pump(s), and vented receiver tank mounted together on a frame. These are available in Simplex, Duplex, Triplex and Quadraplex systems.

When sizing and selecting a Pressure Motive Pump, Four system conditions are required:

(See Diagram on following page)

- 1 **Condensate Load:** If condensate from several sources of equipment is required to be pumped, sum up the maximum flow rate of condensate each could produce separately.
- 2 **Motive Pressure:** Normally steam is used; however, other gases can be used to pump the condensate, including Air or Nitrogen.
- 3 **Filling Head:** The Filling Head is measured between the bottom of the receiver tank and the top of the pump tank. It has a significant effect on pump capacity.
- 4 **System Back Pressure:** Pressure in condensate return line that pump will be operating against, as determined by condensate return line pressure and vertical height condensate must be lifted.

Sample System Conditions:

1	Condensate Load	8,000 lbs/hr
2	Motive Steam Pressure	100 PSIG
3	Filling Head	12"
4	System Back Pressure:	40 PSIG

(To find the pressure required to lift condensate in PSIG, multiply Vertical lift in feet by 0.433)

For PMP Selection: Consult PMP Sizing Capacity Chart using 100 PSIG inlet pressure and 40 PSIG back pressure. A 2" x 2" pump has a capacity of 8,500 lbs/hr and is an appropriate selection. Pump choices are models PMPC, PMPF and PMPSS.

How to specify when ordering:	Example:
1) Model	PMPC
2) Size of Pump(s)	2" x 2"
3) Stand-alone Pump or Pump with Receiver Tank (Note: Size of Receiver Tank must be specified when ordering Pump with Receiver Tank)	Simplex or Duplex
4) Options	Gauge glass
5) When ordering a Customized Skid System, please confirm and specify Receiver size.	

Vented Receiver (Open-Loop System)

Receiver & Vent Sizing

The purpose of the vented receiver is to neutralize the pressure inside the condensate return line so condensate will properly drain from the processes and into the pump tank. An undersized vent will increase the velocity of flash steam in the vent pipe, potentially pulling condensate from the receiver tank out the vent. It may also increase pressure in the receiver and condensate return line upstream of the receiver, possibly causing issues with condensate drainage from the steam traps. The table below lists vent and corresponding receiver sizes based on the amount of flash steam. The amount of flash steam generated is determined by the condensate flow rate and condensate pressure entering the vented receiver.

Determine the amount of condensate in lbs/hr flowing into the vented receiver. The percentage of condensate that will flash into steam is based on the initial condensate pressure and the pressure inside the vented receiver. Since we are trying to achieve 0 psig, reference the 0 psig flash tank pressure to determine % flash steam. Multiply the % flash by the total condensate load.

Example: 10,000 lbs/hr of condensate is generated at an estimated steam pressure of 20 psig. The percent (%) flash steam is **4.9%**. **Quantity of flash steam = .049 x 10,000 = 490 lbs/hr.**

From the table, select a Vent and Receiver size which can handle **600 lbs/hr** of flash steam. (4" vent with a 10" receiver diameter and 36" length.)

PERCENT (%) FLASH STEAM										
Produced when condensate is discharged to atmosphere or into a flash tank controlled at various pressures										
Condensate Pressure (PSIG)	Flash Tank Pressure (PSIG)									
	0	5	10	20	30	40	60	80	100	
5	1.6	0.0

Pump & Trap Combinations

PMPT & WPT

What is a Pump-Trap?

A Pump-Trap is a float-operated steam trap that works in conjunction with a steam powered condensate return pump (Pressure Motive Pump). It is used when system conditions prevent a steam trap from effectively discharging condensate due to excessive back-pressure, or when it is desirable to operate a heat exchanger in vacuum.

What is a Pump-Trap used for?

A **Pump-Trap** is used in place of a Steam Trap to drain condensate from a process application when the steam pressure in the process is not sufficient to push the condensate thru the steam trap and into the condensate return line. When steam pressure in a Heat Exchanger is less than the back pressure on the discharge side of the steam trap, the condensate backs up, causing inconsistent heat transfer and potential waterhammer. This frequently occurs on applications where a temperature control valve is used to supply steam to a Heat Exchanger based on product temperature and flow rate. The temperature control valve increases and decreases steam flow to the Heat Exchanger to satisfy the temperature set point. When system demand is high, the steam pressure in the Heat exchanger is most likely adequate to overcome system back pressure; however, when system demand decreases, steam pressure to the Heat Exchanger must also decrease and can fall below the back pressure. This condition is referred to as Stall, since it causes condensate to back up into the Heat Exchanger. To prevent condensate backup under stall conditions, a pump-trap must be used in place of a steam trap.

Pump with **Internal** Steam Trap (PMPT)

The **PMPT** pressure motive pump has an internal steam trap. The compact design makes it a suitable choice for most applications.

Pump with **External** Steam Trap (WPT)

The **WPT** is a stand-alone pump unit with a separate steam trap mounted on a common base. It is used when capacity requirements exceed that of the PMPT model.

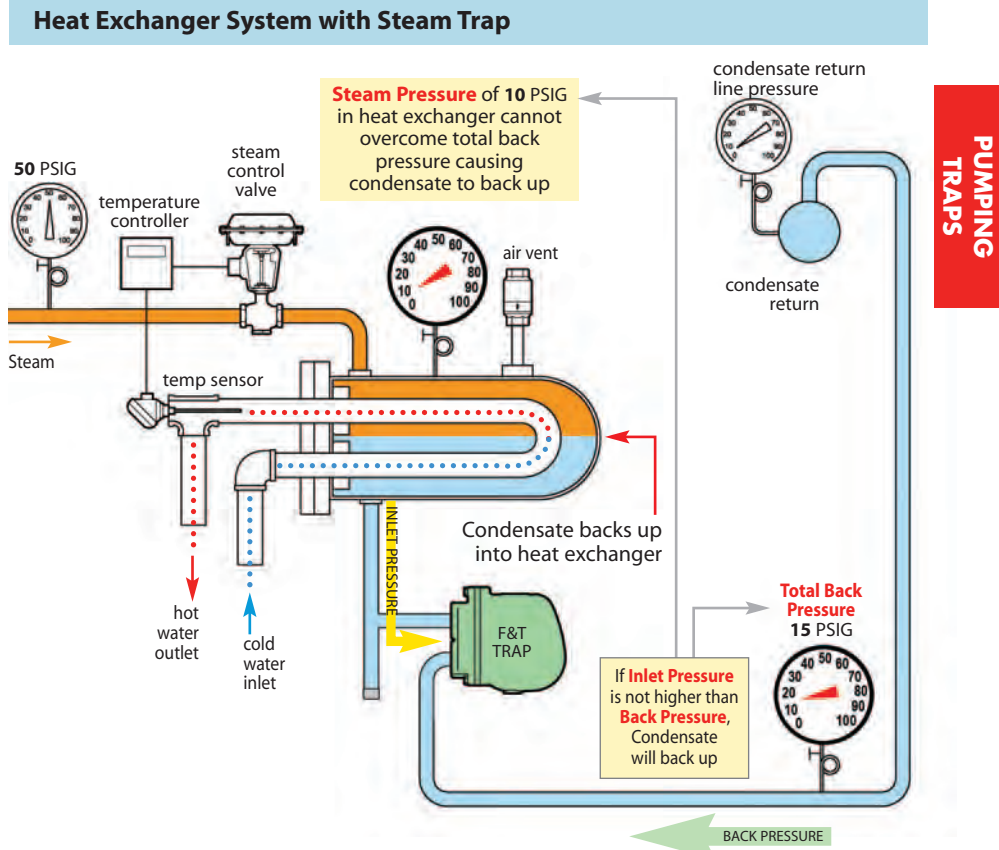

Why use a Pump-Trap?

Problem:

Condensate Backs Up Into Heat Exchanger

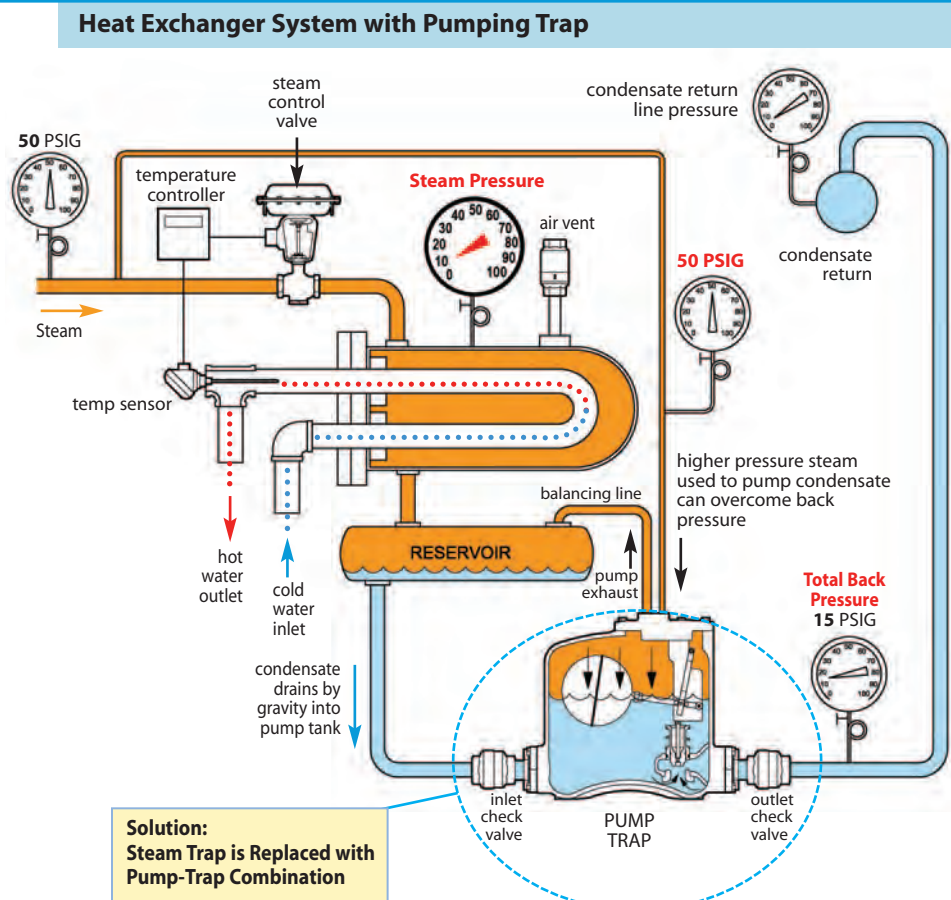

The diagram shows a temperature control valve delivering steam to a Heat Exchanger that is using steam to heat water. Condensate formed in the heat exchanger is being discharged through the steam trap into the condensate return line. This particular application demonstrates what happens when the return line is elevated and/or pressurized. The plant steam pressure on the inlet side of the control valve would be adequate to purge (push) the condensate through the trap and into the return line. However, the steam pressure in the heat exchanger is controlled by the valve and is dependent on the demand of the system. When the demand for HOT water is low, the steam pressure in the Heat Exchanger falls below the back pressure and the system backs up with condensate, creating unstable temperature control and waterhammer. This undesirable condition, referred to as Stall, occurs when the steam pressure in the heat exchanger falls to or below the system back pressure due to a decrease in the demand (flow rate) of hot water.

Solution:

Use a Pump-Trap to Avoid Condensate Back-up & Improve Temperature Control

To eliminate condensate backing up (STALL), the standard float trap is replaced with a PUMP-TRAP. When steam pressure in the Heat Exchanger is greater than the back pressure, the steam pressure will push the condensate through the Pump-Trap and it functions like a standard float-operated trap. When the steam pressure to the Heat Exchanger drops below the back pressure, the condensate backs up inside the PUMP-TRAP, raising the float. When the trip point of the mechanism is reached, the high-pressure steam valve will open to drive the condensate out.

How a Pump-Trap Works

Operation of a PUMP-TRAP with a Heat Exchanger (HX):

The steam pressure to the HX will vary depending on the flow rate of hot water required by the system. Let's assume the HX was sized for a maximum flow rate of 40 GPM of HOT water at 140°F using 30 PSIG steam. When maximum flow rate of water is required, the 30 PSIG steam pressure is more than adequate to push the condensate generated thru the steam trap against the 15 PSIG back pressure. Now, if the hot water requirement reduces from 40 to 20 GPM, the steam flow (lbs/hr) to the Heat Exchanger must drop by about half. Since it is the same size HX, the steam temperature (steam pressure) must also reduce (see table below).

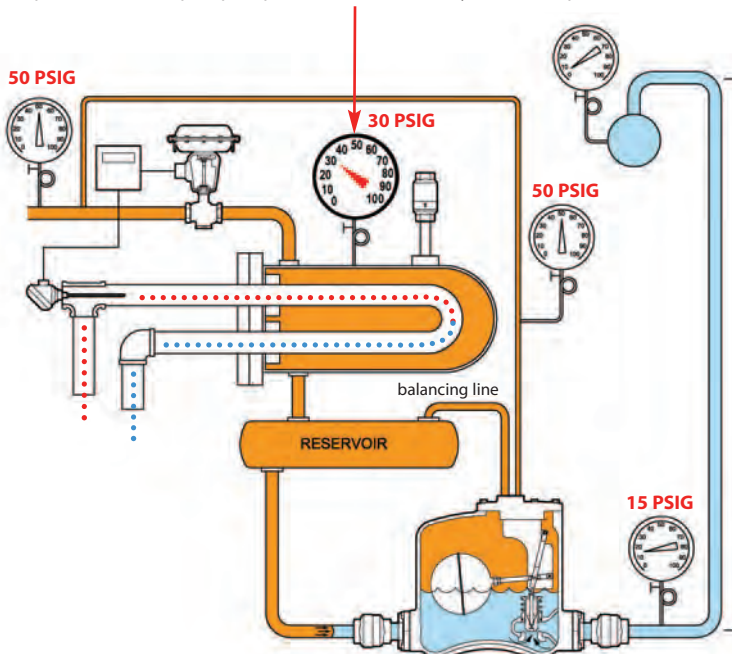

Steam Pressure vs. Hot Water Required

Flow Rate Water (gallons per minute)	Steam Usage (lbs/hr)	Steam Pressure in Heat Exchanger (PSIG)	Condensate Generated (same as steam used)	
40	1,900	30	1,900	Trap Mode
35	1,650	15	1,650	Stall Point
32	1,530	10	1,530	Pump Mode
20	950	-6.6 (Vacuum)	950	

TRAP Mode

The system is operating with **30 PSIG** inlet pressure to the heat exchanger. The Pump-Trap unit functions like a standard float-operated trap. Condensate is pushed thru the pump-trap into the return line by the steam pressure in the HX.

Vent Outlet: Open position, allowing pressure in the pump tank to equal pressure in the heat exchanger, allowing condensate to freely enter Pump-Trap by gravity, even under vacuum.

Motive Inlet: Closed position

1 TRAPPING Mode: Inlet steam pressure is higher than back pressure. Steam pushes condensate through Pump-Trap.

How a Pump-Trap Works

PUMP Mode

The pressure in the HX has now dropped to **10 PSIG**. This was in response to a fall off in demand of hot water. Based on this particular size HX, 10 PSIG steam will heat 32 GPM of water. Since back pressure is 15 PSIG, the system is stalled and condensate is beginning to back up into the system and the float continues to rise.

Vent Outlet: Open position, allowing pressure in the pump tank to equal pressure in the heat exchanger, allowing condensate to freely enter Pump-Trap by gravity.

Motive Inlet: Closed position

2 PUMP TANK FILLS: Inlet steam pressure falls below back pressure. Steam can no longer push the condensate through the Steam Trap.

Condensate rises to a level that the float triggers the inlet steam valve and closes the vent valve. Full line pressure steam (50 PSIG) enters thru the inlet valve on top of the pump body to discharge the condensate. Because of check valves, condensate will not flow back to HX and is discharged to the condensate return line. Unit will continue to operate and cycle in pump mode as long as pressure in the HX is below back pressure. Pump-Trap will also operate in vacuum conditions.

Vent Outlet: Closed

Motive Inlet: Open; steam pressure (50 PSI) enters tank and discharges condensate.

3 PUMP Mode: Pump is activated. When the pump tank has filled to the trip point, the mechanism triggers, opening the motive gas inlet valve and simultaneously closing the vent valve. This allows motive pressure to enter the pump body, which drives the condensate thru the outlet check valve and into the condensate return line. During the discharge cycle, the liquid level and the float inside the pump tank drop. When the lower trip point is reached, the mechanism closes the motive inlet valve and opens the vent valve so the pump-trap can fill on the next cycle.

Steam Trap internal to pump body
will function like a normal float trap discharging condensate as its formed. If condensate backs up, the pumping mechanism will use motive steam pressure to discharge the condensate.

Typical Applications

The **PMPT** low-profile pressure motive pump & trap combination has an internal steam trap for draining heat exchangers and other equipment whose steam pressure is modulated by a temperature regulator or a temperature control valve. In these applications the steam pressure in the heat exchanger may not be sufficient to overcome the back pressure in the condensate return line. When this condition occurs, the pressure powered pump takes over and uses high pressure steam supplied to the pump to discharge the condensate. When sufficient pressure does exist, the PMPT functions like a standard steam trap. Its small compact design is perfect for applications with limited space.

Pump-Traps facilitate condensate discharge under all operating conditions, including vacuum.

Features

- Low-profile design allows for condensate drainage of equipment positioned close to the floor
- Equipped with our proven, **Patented "Snap-Assure"** mechanism which extends the useful life of the pump
- Internal mechanism can be removed from the top of the pump while pump remains piped in line
- Mechanism incorporates heat-treated stainless steel wear items
- Dual compression springs made from Inconel-X-750 for high-temperature, corrosive service

NOTE: Reservoir - Pump-Trap Combination may require a reservoir above the pump to collect condensate generated in the heat exchanger during the discharge cycle of the pump. Consult Reservoir Sizing Guidelines or contact factory for additional information.

Options

- Horizontal pipe reservoir (recommended)
- Motive and vent piping
- Motive piping components such as steam trap, strainer and regulator
- Packaged systems available with reservoir, base and skid
- Gauge Glass
- Insulation Jacket
- ASME Code Stamp

External Steam Trap

WPT

PUMPING
TRAPS

WPT-Series Pump-Trap Combinations simplify Selection & Installation of Pressure Motive Pumps

- 3 size ranges available
- Up to 13,000 lbs/hr of condensate load

WPT3 • 1 1/2" x 1 1/2" Inlet x Outlet

(PMPLS with 2" FTE-200 Steam Trap)

Typical Applications

WPT Pump-Trap Combinations are excellent for draining condensate from heat exchangers and other equipment whose steam pressure is modulated by a temperature regulator or a temperature control valve. In these applications the steam pressure in the heat exchanger may not be sufficient to overcome the back pressure in the condensate return line. When this condition occurs, the pressure powered pump takes over and uses high pressure steam supplied to the pump to discharge the condensate. When sufficient pressure does exist, the WPT functions like a standard steam trap.

Pump-Traps facilitate condensate discharge under all operating conditions, including vacuum.

Pump-Trap Features

- Pump and Steam Trap are pre-mounted together on a single base for easy installation
- Higher capacities than Pump-Trap combinations with internal steam traps (PMPT)
- Engineering and selection is simplified using a pre-mounted system

NOTE: Reservoir - Pump-Trap Combination may require a reservoir above the pump to collect condensate generated in the heat exchanger during the discharge cycle of the pump. Consult Reservoir Sizing Guidelines or contact factory for additional information.

Recommended Reservoir sizes for Pump-Trap Applications

RESERVOIR PIPE LENGTH in feet (ft)					
Condensate Load (lbs/hr)	Reservoir Pipe Size (Diameter)				
	3"	4"	6"	8"	10"
0-500	2'				
1,000	2'				
1,500	3'	2'			
2,000	3.5'	2'	1'		
3,000		3'	2'		
4,000		4'	2'	1'	
5,000		6'	3'	2'	
6,000			3'	2'	
7,000			3'	2'	
8,000			4'	2'	
9,000			4.5'	3'	2'

Capacity Correction Factors for Alternate Filling Heads

Model	Filling Head					
	0"	6"	12"	18"	24"	36"
PMPT	0.70	1.00	1.16	1.28		
WPT3	0.62	0.70	1.00	1.10	1.20	1.35
WPT4	0.62	0.70	1.00	1.10	1.20	1.35
WPT5	0.70	0.84	1.00	1.10	1.08	1.20

NOTE: When the filling head differs from the standard filling height, the capacity of the pressure power pumps are either increased or decreased. For example, a WPT4 has a filling head of 24" as opposed to a standard filling head of 12", will have a capacity increase of 20%. Multiply the value found in the Capacity Table above by 1.2.

Sizing & Selection

Pump-Trap Sizing:

When the steam pressure in the heat exchanger is higher than the return line back pressure, the PUMP-TRAP functions like a standard float-operated TRAP, allowing the steam pressure in the heat exchanger to discharge the condensate. Under these conditions, the unit is in TRAP mode. When the steam pressure in the heat exchanger falls below the back pressure, the condensate backs up into the body of the pump-trap, raising the float and opening the motive steam inlet valve, which then pumps the condensate into the return line. Under these conditions, the unit is in PUMP mode. We therefore have two separate and distinct capacities; the **PUMP CAPACITY** (when operating in Pump Mode) and the **TRAP CAPACITY** (when operating in Trap Mode).

In the example below, the system will be analyzed to determine when the Pump-Trap is in Trap Mode and when it is in Pump Mode, and the specific capacity requirement of the pump. If the total back-pressure of the condensate return line is known, the Pump-Trap should be selected with sufficient pump capacity to handle the condensate load at the system stall point. (i.e.; when the steam pressure is equal to the total back-pressure). Alternatively, if the total back-pressure is not known, it is best to select a pump-trap with enough pump capacity to handle the maximum condensate load of the application. (i.e., at maximum steam pressure and flow). Refer to Sizing Charts.

Reservoir Sizing: (Refer to chart on previous page)

When using a Pump-Trap, a condensate holding reservoir should be installed above the pump-trap and below the heat exchanger (shown below). This will enable the condensate to collect while the pump is in the discharge cycle, thus preventing condensate backup. When back pressure against the pump outlet is less than 50% of the steam pressure to the heat exchanger, the pipe lengths given in the chart can be reduced by half.

Heat Exchanger (HX) using Steam to heat Hot Water

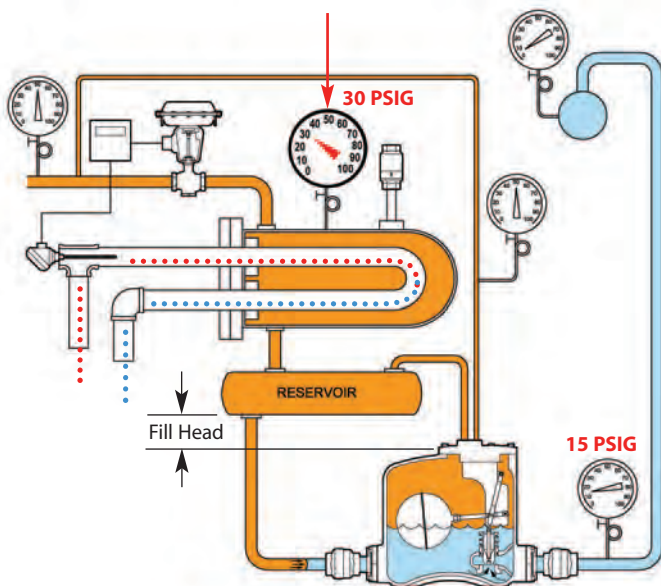

The following example describes a Heat Exchanger (HX) using Steam to heat domestic hot water for a medium size apartment complex. Note that the hot water usage varies significantly depending on the time of day. The physical size of the heat exchanger needed (sq. ft. of surface area) is based on the following criteria: **(1) MAXIMUM** water usage (GPM), **(2)** the temperature rise of the water, and **(3)** what pressure steam will be used to heat the water during maximum demand.

Note: The selection of the steam pressure (which determines the steam temperature), to heat the water at maximum demand (flow rate), is the primary factor in heat exchanger sizing.

The application is requiring water to be heated from **45°F** to **140°F** in a HX using Steam. The maximum flow rate has been determined to be **60 GPM**. The Steam Trap will be discharging into a condensate return line that may have a Total Back Pressure of **15 PSIG** and the flow rate of heated water could be as low as **20 GPM**. The facility engineer has chosen to base the HX size on using **50 PSIG** of steam pressure. Therefore, the size of the heat exchanger was selected based on heating **60 GPM** of water using **50 PSIG** of steam.

TRAP Mode

The system is operating with **30 PSIG** inlet pressure to the heat exchanger. The Pump-Trap unit functions like a standard float operated trap. Condensate is pushed thru into the return line by the steam pressure in the HX. Based on this particular size HX, 30 PSIG steam will heat 53 GPM of water.

$$\Delta P \text{ Trap} = 30 \text{ psig} - 15 \text{ psig} \\ = 15 \text{ psi}$$

PUMP Mode

In response to a reduction in demand of hot water, the pressure in the HX has now dropped to **10 PSIG**. Based on this particular size HX, 10 PSIG steam will heat 43 GPM of water. Since back pressure is **15 PSIG**, the system is stalled and condensate backs up into the system; the float will continue to rise to activate the pump and discharge the condensate.

Summary of conditions for a Heat Exchanger (HX) using Steam to heat Water

Set of conditions used to size the Heat Exchanger:

- | | | |
|---|---------|----------------|
| 1) Maximum Flow of Hot Water | = | 60 GPM |
| 2) Water temperature required | T_o = | 140°F |
| 3) Steam Pressure in Heat Exchanger | = | 50 PSIG |
| 4) Temperature of 50 PSIG Steam | T_s = | 298°F |
| 5) Inlet Water Temperature | T_i = | 45°F |
| 6) Temperature Rise of Water
(140°F - 45°F = 95°F) | = | 95°F |

What is the Heat Transfer Rate (E) to heat 60 GPM of water from 45°F to 140°F?

$$E \left[\frac{\text{Btu}}{\text{hr}} \right] = \text{Water Flow Rate (GPM)} \times 500 \times \text{Temp Rise (°F)}$$

$$= 60 \times 500 \times [140^\circ - 45^\circ \text{F}]$$

$$= \mathbf{2,850,000 \text{ Btu/hr}}$$

How much Steam Flow is required?

$$Q_s (\text{steam}) = \frac{E}{LH} \quad (\text{For 50 psi steam, the LH is 912 Btu/lb})$$

$$= \frac{2,850,000 \text{ Btu/hr}}{912 \text{ Btu/lb}}$$

$$= \mathbf{3,125 \text{ lbs/hr}}$$

$$E = U \times A \times \Delta T$$

Fundamental formula for heat transfer and the basic formula for HX sizing

The formula shows that the heat transfer rate (**E**) between the hot steam and cold water is directly proportional to the Surface contact area (**A**) inside the HX and the difference in temperature between the steam and water (ΔT). The more surface area (larger HX) the more heat will get transferred or the hotter the steam temperature (higher pressure) the more heat will get transferred.

- E** = **Heat Transfer Rate** in Btu/hr of the energy in the steam to the water. The flow of steam (**Q_s**) required in lbs/hr is determined by dividing **E** by the Latent Heat of Steam (LH) in Btu/lb.
- U** = is referred to as the **Overall Heat Transfer Coefficient**. This depends on the HX type and the materials involved. Typical **U** values are 120 for Stainless Steel and 200 for Copper. We will use 120 for Stainless Steel HX.
- A** = The internal **Surface Area** (size) of the HX in Sq. Ft. The size of a HX is determined by the surface contact area between the Steam and Water.
- ΔT** = **Average Temperature Difference** between Steam & Water. Since the water temperature changes as it flows thru the HX, we need to use the average temperature difference between the steam temperature and the water temperature. See formula below:

Average Temperature Difference

$$\Delta T = \frac{(T_s - T_i) + (T_s - T_o)}{2}$$

$$= \frac{(298 - 45) + (298 - 140)}{2}$$

$$\Delta T = \mathbf{205^\circ F} = \text{Avg Temp. Difference}$$

Heat Exchanger Size

$$E = U \times A \times \Delta T$$

Above formula is rearranged to solve for **A**:

$$A = \frac{E}{U \times \Delta T}$$

$$= \frac{2,850,000}{120 \times 205}$$

$$\mathbf{A = 116 \text{ (sq ft.)}}$$

The actual size of a Heat Exchanger depends on many factors; however, based on the criteria given, **116 sq. ft** of surface area is required to heat 60 GPM of water from 45°F to 140°F, based on a steam pressure of 50 PSIG.

Sizing & Selection

Stall Condition:

When the steam pressure in the HX is equal to the back pressure of **15 PSIG**, the condensate will no longer drain out of the HX. The Pump-Trap will now need to operate in Pump Mode to remove the condensate from the HX. We need to calculate how much condensate will be produced when there is **15 PSIG** in the HX.

$$\Delta T = \frac{(T_s - T_i) + (T_s - T_o)}{2}$$

[From the steam table, 15 PSIG steam has a temp of 250°F]

$$= \frac{(250 - 45) + (250 - 140)}{2}$$

$$\Delta T = 157.5^\circ \text{ F} = \text{Avg Temp. Difference}$$

To find out how much energy will be transferred to the water, we use the ΔT calculated above in our heat transfer equation.

$$E = U \times A \times \Delta T$$

$$= 120 \times 116 \times 157.5$$

$$= \mathbf{2,192,400 \text{ Btu/hr}}$$

To determine how much steam is required to heat the water, we use the following formula. (LH = Latent Heat.)

$$Q_s \text{ lbs/hr} = \frac{E}{LH} = \frac{2,192,400}{946} \quad (\text{For 15 psig steam, the LH is 946 Btu/lb})$$

$$\text{Steam Flow} = \mathbf{2,318 \text{ lbs/hr}}$$

When the HX stalls, we will be using 2,318 lbs/hr of steam and will need to pump 2,318 lbs/hr of condensate. The pump-trap must be sized to handle this condensate load since it is the maximum load under stall conditions (see table below).

Table based on a HX size of 116 ft² and back pressure of 15 PSIG

The following table summarizes the above results and shows how the steam flow, pressure, temperature and latent heat vary as a function of the water flow rate. It can be seen that the system is operating in **Trap Mode** between water flow rates of 60 to ~46 GPM, and in **Pump Mode** between ~46 to 20 GPM (based on 15 PSIG back pressure). Also, at flow rates below 35 GPM, the steam pressure inside the HX is below atmospheric pressure (0 PSIG).

Flow Rate Water (GPM)	Steam Usage (lbs/hr)	Steam Pressure in HX (PSIG)	Steam Temp in HX (°F)	Latent Heat of Steam (Btu/lb)	Condensate Generated (lbs/hr)	Trap Differential Pressure (PSI)	System Condition
60	3,125	50	298	912	3,125	35	Trap Mode

Accessories & Options

PMP-Condensate Return Pumps & Pump-Trap Combinations

Watson McDaniel offers a full line of accessories for our Condensate Return Pumps and Pump Systems. If there is something you don't see, please call our factory and we will do our best to help you.

ASME CODE STAMP for Receiver Pump Tanks

Four standard condensate receiver sizes are available for Pressure Motive Pump Systems: 21, 48, 75 and 116 gallons. Custom receiver fabrication is available with Watson McDaniel's ASME-certified fabrication facility. ASME Code is Standard on 21, 48, 75 and 116 gallon receiver tanks and PMPF, PMPLS, PMPSS pump tanks.

ASME Code Stamp:	Model Code
for PMPC, PMPC & PMPNT Pump Tanks	Contact Factory

Cycle Counter

The Digital Cycle Counter option allows monitoring of pump cycles for the purpose of scheduling maintenance and repairs, as well as calculation of condensate flow through the pump (i.e. returned condensate). There are several options available depending on the PMP selected as well as the operating conditions. Therefore, proper selection is required to ensure proper function and operation. See below for selection, or consult factory for additional assistance.

- Pump Only (Open Loop), with pump back pressure 15 psig or above – Standard
- Pump Only (Open Loop), with pump back pressure below 15 psig – Low Pressure Option
- Pump-Trap (Closed Loop) – Special option required – consult factory.

Pump-traps (closed loop) can not use the pressure switch because the vent pressure will vary, so pressure differential can not be guaranteed.

Cycle Counter (fits all PMPs) Open Loop Systems Only	Model Code
Digital Cycle Counter	1529100
Digital Cycle Counter with auxiliary contacts	1529102
Low Pressure Cycle Counter with auxiliary contacts	1529103
Low Pressure Cycle Counter w/o auxiliary contacts	1529104
Closed Loop Cycle Counter	2450300

Gauge Glass

Pumps tanks are available with gauge glass to show condensate level inside the tank (bronze or stainless steel retainer).

Gauge Glass for:	Model Code	Center-to-Center
Standard Bronze Gauge Glass		
PMPC, PMPF, PMPLS (stand alone pumps)	1848100	12.75"
PMPT (stand alone pump)	1848103	8"
PMPM (stand alone pump)	1848102	10"

"T-Bone"
Connection

Vertical Discharge Pump

Vertical Discharge Pump with "T-Bone" connection allows inlet and outlet condensate hook-ups to be made above the pump. This is an advantage when space is limited around the base of the pump due to equipment or piping obstructions.

Vertical Discharge Pump	Model Code
T-Bone Connections available for Stand Alone Pump	PMP-TBONE

Check Valves - Stainless Steel

The **Inlet Check Valve** on PMP systems require a very low opening pressure (cracking pressure) so that the liquid will freely enter the pump tank. The proper check valve is critical to the operation of the PMP system. Watson McDaniel uses only Stainless Steel Check Valves with a maximum of 1/4 PSI cracking pressure. (See Check Valves in Pipeline Accessories.)

A **Quick-Fill Swing-Style Check Valve** is available. Use for extremely low fill head applications to increase fill rate of pump. (1 1/2" only).

Check Valves - NPT	Model Code

PMP-Condensate Return Pumps & Pump-Trap Combinations

Mechanism for Pump Tanks (with Patented “Snap-Assure” Feature)

The Patented “Snap-Assure” feature extends the useful life of the pump by assuring the internal mechanism toggles at every fill and discharge cycle. These mechanisms are simple and easy to replace, and are a cost-effective way to make your pump as good as new. They will also fit other manufacturers’ pump tanks (minimum 19.25” activation length required when using standard PMPC or PMPF mechanisms. Contact factory for other mechanism retrofits).

**ASME
Certified**

Watson McDaniel's fully equipped ASME qualified fabrication facility stands ready to assist you with all of your fabrication needs. Our engineering staff specializes in the design of Pressure Motive Condensate Pumping Systems for both industrial and institutional applications. You can order either standard packages, available from stock, or specialized systems to meet your specific needs.

Condensate
Pumps

W4100, W4200 & W4300 Condensate Pumps

Watson McDaniel's **Condensate Return** and **Boiler Feed** Pumps are equipped with Cast Iron bodies and Bronze Impellers. The pump receiver tanks are available in either **Carbon Steel** (W4100), **Cast Iron** (W4200), or **Stainless Steel** (W4300) in Simplex or Duplex configurations.

Typical Condensate Pump Features

- Fabricated Steel Receivers (W4100), Cast Iron Receivers (W4200), Stainless Steel Receivers (W4300)
- Simplex and Duplex Packages
- Bronze Fitted Centrifugal Pumps
- Energy Efficient 3450 RPM motors
- Ceramic Pump Seal
- Heavy-duty Float Switch

Characteristics of Condensate Return Pumps Vs. Boiler Feed Pumps

Condensate Return Pumps

Used for returning condensate from the facility back to the boiler room. In Condensate Return applications, the operation of the pump is controlled by a **Float Switch** located on the receiver tank. The pump turns on when the receiver tank is full and shuts off when emptied. Duplex units contain a **Mechanical Alternator** float switch to alternate operation between the two pumps.

Boiler Feed Pumps

For Boiler Feed applications, the operation of the pump is controlled by the **water level control system** on the boiler. When the boiler requires water, the pump switches on pumping water from the receiver into the boiler. The receiver tank also contains an internal **make-up water valve** actuated by a stainless steel float. If the amount of condensate being returned to the receiver tank is inadequate, additional boiler feed water is automatically added to the receiver tank.

SIMPLEX

Float Switch is used to activate the pump.

SIMPLEX & DUPLEX

Water Level Control System on boiler is used to activate the pump.

Automatic Make-up Water Valve is activated by a level float that adds additional boiler feed water to the receiver tank if required.

DUPLEX

Mechanical Alternator (used in place of the Float Switch found on Simplex units) is used to cycle operation between the 2 pumps.

Introduction

Simplex vs. Duplex Pump Operation:

A **Simplex System** contains a single pump and receiver tank. **Duplex Systems** contain two pumps on a common receiver tank allowing the second pump to serve as a back up in case of failure.

Mechanical Alternator/Float Switch

(must be ordered separately with Duplex units)

For Duplex Condensate Return Pumps

the Float Switch is replaced with a Mechanical Alternator. The Mechanical Alternator is attached to a float and activates only one pump at a time in an alternating manner. The Mechanical Alternator switches power between the two motors so that the runtime of each pump is shared, allowing the system to continue operation in the event of a single pump failure.

Motors & Controls

Single-Phase motors

Single-phase motors supplied with these pumps have overload protection and therefore do not require ancillary motors starters. Single-phase motors can be wired directly to the Float Switch (for Simplex units) or the Mechanical Alternator (on Duplex units) and no control panel is required for installation.

3-Phase motors

3-Phase motors do not have overload protection and therefore require a separate **Motor Starter** to operate. A Motor Starter contains a set of Electrical Contactors with overload protection (OL) to protect the motor. The standard Float Switch or Mechanical Alternator/Float Switch is wired to the Motor Starter and closes the Contactors to start the pump. The OL device incorporated into the Motor Starter protects the motor from damage. A separate circuit breaker or fuse box is still required to protect the circuitry.

Typical
Motor Starter

NEMA-12 Control Panel

For **Simplex** units, the control panel would include a single motor starter with a single **HOA** (Hand-Off-Automatic) selector switch to turn the pump on manually to verify functionality; or, to set in automatic mode along with a single Motor Circuit Protector switch to shut power off to the pump in case of overload. The purpose of the Motor Circuit Protector is to protect the wiring to the pump eliminating the need for a separate circuit breaker or fuse box.

For **Duplex** systems, the control panel would include two motor starters, two HOA Switches and two Motor Circuit Protector switches.

Float Switch for Simplex Condensate Return Units: Wiring Diagrams

The diagrams below show typical Single-phase & 3-phase wiring diagrams for the float switch used on Simplex Condensate Return Units. The Float Switch can be used to turn on a Single-phase motor directly or to activate a **Motor Starter**. A Motor Starter is required to operate 3-phase motors.

Float Switch for Simplex Pumps

Float Switch Wired Directly to a Single-Phase Motor

Float Switch Turning on a 3-Phase Motor Using a Motor Starter

NEMA 1 Control Panel
Motor Starter for
Simplex Pumps

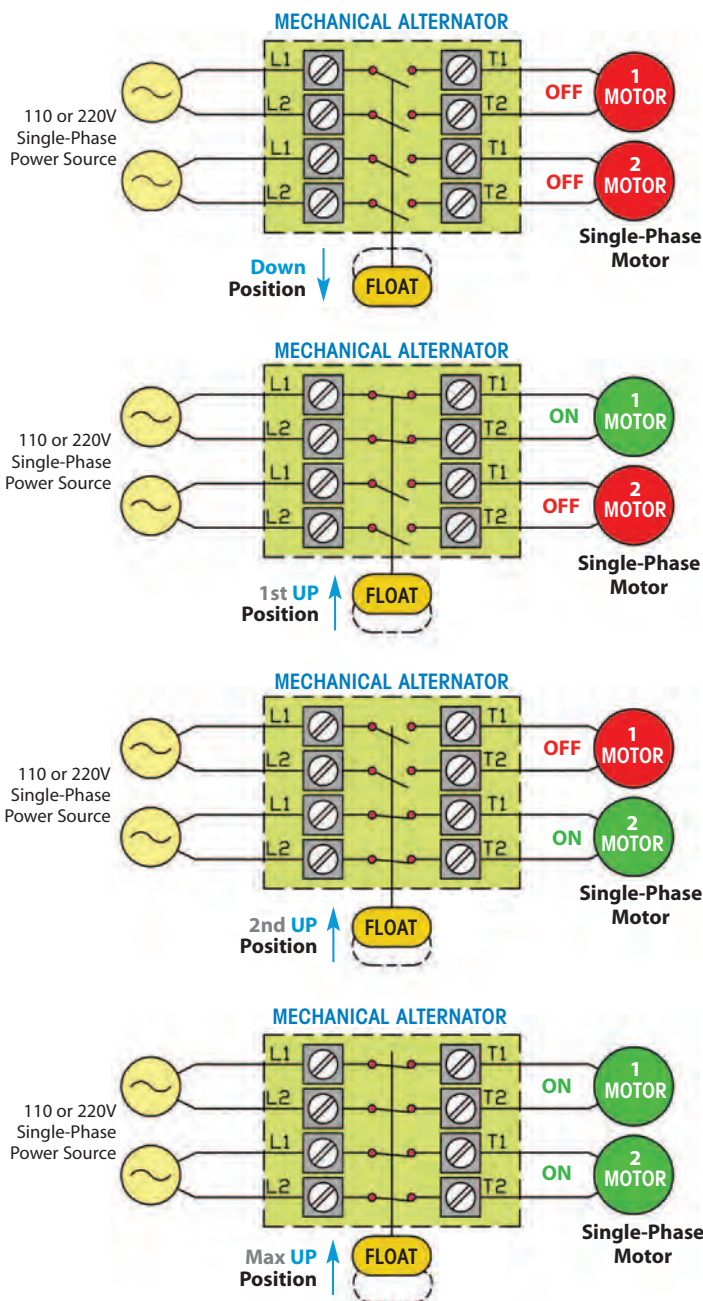

Introduction

Mechanical Alternator for Duplex units: Wiring Diagrams

The diagrams below show a Mechanical Alternator operating two separate Single-Phase Motors required to operate a Duplex Pump System. The Mechanical Alternator can also be used to operate two separate Motor Starters which in turn would be used to operate two separate 3-phase motors.

Mechanical Alternator Operating Two Single-Phase Motors

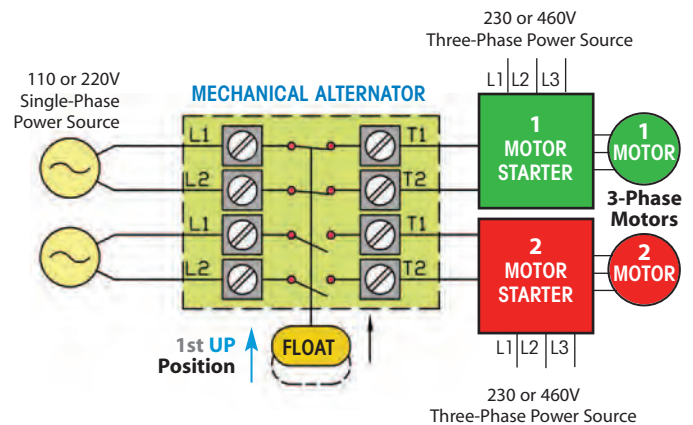

Explanation of Float Travel Position On Mechanical Alternator

Normal Operation: Switches will cut in and cut out at the high point of distance **A + B** given in the Figure below. Under normal conditions, as long as one pump alone is able to handle the incoming water, the pumps will alternate at this distance. With the water level continuing to rise, the second switch will cut in and start the second pump, when the float reaches the top of distance **D**. Both pumps will continue to run until the float returns to the lower point of distance **D + C**, where one pump will cut out. The other pump will continue until the float reaches the low point of distance **B**.

Mechanical Alternator Operating Two 3-Phase Motors

The Mechanical Alternator can also be used to operate two separate Motor Starters which in turn would be used to operate two separate 3-phase motors. Schematic shows **Motor Starter 1** activated which will turn on the 1st motor.

Operation of CONDENSATE RETURN Pumps

Condensate Return Pumps are designed to operate intermittently, discharging condensate only when the receiver tank is full. This is accomplished with a float switch that energizes the pump when the float rises above a set point. Once started, the pump will continue to operate until the water level drops below the bottom set position of the float switch. On Duplex condensate return pumps, a Mechanical Alternator float switch is mounted to the receiver so that both pumps are used in an alternating manner.

Simplex Unit

Duplex Unit

Condensate Return Pump Piping Diagram

Operation of BOILER FEED Pumps

For Boiler Feed applications, the operation of the pump is controlled by the **water level control system** on the boiler. When the boiler requires water, the pump switches on pumping water from the receiver into the boiler. The receiver tank also contains an internal **make-up water valve** actuated by a stainless steel float. If the amount of condensate being returned to the receiver tank is inadequate to supply the boiler, additional make-up water is added to the receiver tank. This condition may occur when more steam is being produced than condensate being returned; common at system start-up.

An overflow pipe is used to dump excess condensate to drain during times when less boiler feed water is required than the amount of condensate being returned. Larger boiler feed tanks may be advantageous to keep systems in balance.

Duplex Boiler Feed Unit

Boiler Feed Pump Piping Diagram

What is required to choose and install an Electric Pump?

Selecting a Condensate Return Pump:	Selecting a Boiler Feed Pump:
<ul style="list-style-type: none"> A Condensate Return Pump contains an automatic float switch in the receiver tank to activate the pump when the tank is filled and deactivate when empty. On Duplex units, the standard float switch is replaced with a Mechanical Alternator float switch to alternate operation between the two pumps. Must be ordered separately. An Electric Alternator is also an option. The capacity of the condensate return pump in Gallons Per Minute (GPM) is based on the amount of Effective Direct Radiation (EDR) in sq. ft. of heating surface in the facility that the pump is expected to handle. <i>For Example: an EDR of 2000 sq. ft. can condense up to 500 lbs/hr of steam which translates to 1.0 GPM of condensate flow. Using a 3:1 safety factor would require a 3.0 GPM Condensate Return pump. The properly sized receiver tank that is adequate for that pump capacity is shown in the model selection chart for Condensate Return units. Larger receiver sizes are always desirable in order to cool condensate.</i> Select a discharge pressure for the pump to overcome all system back pressures including frictional piping losses. Pump discharge pressures of 20-50 PSI are available. Selecting a pump with a significantly higher discharge pressure than required can cause pump to cavitate. 	<ul style="list-style-type: none"> For a Boiler Feed Pump, the operation of the pump is controlled by the water level control system on the boiler. When the boiler requires water, the pump switches on pumping water from the receiver into the boiler. The receiver tank also contains an internal make-up water valve actuated by a stainless steel float. This is used if the amount of condensate being returned to the receiver tank is inadequate. On Duplex boiler feed pumps, an Electric Alternator is required to cycle operation between the two pumps. The capacity of the boiler feed pump in Gallons Per Minute (GPM) is based on the Boiler horsepower (hp). <i>For Example: A 15 horsepower boiler will produce up to 500 lbs/hr of steam when running at maximum load which translates to requiring 1.0 GPM of water make-up to the boiler. Using a 3:1 safety factor would require a 3.0 GPM Boiler Feed pump. The recommended receiver sizes based on boiler horsepower are shown in selection chart.</i> Select a discharge pressure for the pump to overcome boiler pressure and all system back pressure including frictional piping losses. Pump discharge pressures of 20-50 PSI are available.

General Information:

Applies to both Condensate Return & Boiler Feed Pumps

- 1) **Select the model** with the appropriate sized receiver and pump discharge pressure. 4100-Series Carbon Steel tank, 4200-Series – Cast Iron tank or 4300-Series – Stainless Steel tank.

Safety factors and proper operating conditions: Pumps have a 3:1 safety factor. The 3:1 safety factor for Condensate Return pumps is based on the maximum condensate that can be produced by the EDR (Effective Direct Radiation) in square feet. For Boiler Feed pumps, the 3:1 safety factor is based on the maximum amount of water that would be required by the boiler (based on Boiler hp). Therefore, when the system is operating at maximum capacity, the pump will operate only one third of the time. Please note: these pumps as configured are not recommended for pumping condensate above 190° F.

- 2) **Motor hp** required for any given pump model is listed in the selection chart. For motor sizes below 1 hp, it is most common to choose single phase motors; (1Ph either 110 or 220 Volts). Single-phase motors (available up to 2 hp) have inherent overload protection (OL) and can therefore be wired directly to the float switch or Mechanical Alternator. This is the simplest method of control and does not require any additional electrical hardware. Since 3-Phase motors do not have inherent OL protection, they require a separate Motor Starter. Motor starters can be purchased separately from an electrical supply house or ordered separately with pump unit. Reference our NEMA 1 or NEMA 12 Control Panels with Motor Starter.
- 3) **Duplex pump units** require the addition of a mechanical or electrical **Alternator** which activates one pump at a time in alternating fashion. **Condensate Return** pumps most commonly use a Mechanical Alternator in place of the standard float switch and must be ordered separately. Refer to Model **MECH-ALT-N1**. For duplex **Boiler Feed** pumps, the **Electric Alternator** option on the NEMA-12 Control Panel (suffix code **E**) must be chosen. An Electric Alternator can also be used with Condensate Return pumps; however, an additional 2-level float switch is required (2-level float switch is Not required on boiler feed units).

Model	W4100	W4200	W4300
Connections	NPT	NPT	NPT
Tank Material	Carbon Steel	Cast Iron	Stainless Steel
Max Disch. Press.	50 PSIG	50 PSIG	50 PSIG
TMO/TMA	190°F	190°F	190°F
Options	Mechanical & electrical alternators; gauge glass; thermometer; discharge pressure gauges; isolation valves; magnetic starters; 1750 RPM motors; control panels; oversized or stainless steel receivers; high temperature components		

Note: For condensate temperatures exceeding 190°F, high temperature pump options are available. Consult Factory.

Typical Applications

Used for general condensate return or for boiler feed applications. Available in Simplex or Duplex configurations with several different receiver sizes available.

How It Works

For Condensate Return Applications:

The float, which is connected to the switch assembly, rises when condensate enters the receiver tank. When the float rises above its set point, it energizes the motor on the pump. Once started, the pump will continue to run until the water level drops below the bottom position of the float switch. There it will de-energize the motor to shut off the pump. This cycle repeats as condensate begins to fill the receiver tank. On duplex systems the float switch is replaced with a Mechanical Alternator-Switch connected to a float. The Mechanical Alternator cycles use between the two pumps, allowing only one pump to run at a time under normal conditions. If the condensate reaches a high water level, both pumps will be activated.

For Boiler Feed Applications:

For Boiler Feed units, the operation of the pump is controlled by the water level control device which is part of the boiler control package. When the boiler requires water, the pump switches on pumping water from the receiver into the boiler. On Duplex boiler feed units, an Electrical Alternator is used to activate one pump at a time in alternating fashion. The receiver tank also contains an internal make-up water valve actuated by a stainless steel float. This is used if the amount of condensate being returned to the receiver tank is inadequate.

Sample Specifications

Pump(s) shall be of the centrifugal type with 2-piece closed bronze impeller, cast iron housing and stainless steel motor shaft. A flat perforated brass strainer shall be provided in the inlet of the pump.

Installation

Place on an elevated, level and substantial foundation in a clean, dry and accessible area. Locate receiver tank inlet below lowest point of the condensate return lines.

Features

- Fabricated steel receivers (W4100), Cast Iron (W4200), Stainless Steel (W4300)
- Simplex and duplex packages
- Bronze-fitted centrifugal pumps
- Energy-efficient 3450 RPM motors
- Automatic venting of mechanical seal
- Ceramic pump seal with carbon face
- Heavy-duty float switch
- All steel and iron receivers over 24 gallons include a threaded NPT overflow port

Options

- Mechanical and Electrical Alternators
- Gauge Glass
- Thermometers
- Discharge Pressure Gauges
- Isolation valves
- Magnetic Starters with HOA Selector Switch
- 1750 RPM Motors
- Larger pumping capacities & higher discharge pressures
- Wide variety of control panels
- Oversized Receivers (45, 60 & 95 gallons)
- Stainless Steel Receivers
- High Temperature (250°F) Components

How to Order an Electric Condensate Return or Boiler Feed Pump

Ordering Guidelines:

- 1) Decide on appropriate Receiver tank material for the application; W4100-Series with Steel Receiver tanks, W4200-Series with Cast Iron Receiver tanks or W4300 with Stainless Steel Receiver tanks.
- 2) Based on the particular application the **model selection charts** are separated on adjoining pages into either Boiler Feed or Condensate Return units. The proper pump model/size in GPM (gallons per minute) to suit the application and recommended receiver size for a Boiler Feed application is based on boiler size measured in Boiler Horsepower. The proper pump model size in GPM and recommended receiver size for a Condensate Return application is based on the Effective Direct Radiation (EDR) in square feet of the heating surfaces throughout the facility that the pump is expected to handle.
- 3) Select a pump discharge pressure that will exceed system back pressure, friction loss in piping and pressure in the boiler (in the case of a boiler feed pump). Selecting a pump with a significantly higher discharge pressure than required can cause pump to cavitate.
- 4) Decide if a Simplex (Single pump) unit is adequate or a Duplex (two pump) unit would be more appropriate in terms of system reliability and redundancy in the event of a pump failure.
- 5) Select Motor Phase and Voltage (reference chart). For smaller units under 1 1/2 hp Single phase motors may be desirable because of ease of installation. For units in excess of 1 1/2 hp, the more efficient and robust 3-phase motors are recommended.

Example Model Code: **W41410JD-3P230**
(Pump Unit)

Duplex Condensate Return Pump, 15 GPM flow rate & 40 PSI discharge pressure & 15 gallon receiver, 1hp, 230 VAC, 60Hz, 3-Phase motor.

Example Model Code: **MECH-ALT-N1**
(Mechanical Alternator)

Note: Since a Duplex pump was chosen, a Mechanical Alternator must be purchased separately to replace the standard Float Switch.

Condensate Return

Boiler Feed

Phase & Voltage Codes for Standard 60/50 Hz Motors

Motor Phase & Voltage		60 Hz Motor Code	50 Hz Motor Code
Single Phase	115 VAC	1P115	1P115E
	208 VAC	1P208	1P208E
	230 VAC	1P230	1P230E
Three Phase	208 VAC	3P208	3P208E
	230 VAC	3P230	3P230E
	460 VAC	3P460	3P460E
	575 VAC	3P575	3P575E

Codes for Specialty Motors (add as a Suffix)

Option	Suffix Code
Totally Enclosed Fan Cooled (1/2 to 3 hp)	TEFC
Explosion Proof – 1/2, 3/4, 1 hp	EP1
Explosion Proof – 1 1/2 & 2 hp	EP2
Explosion Proof – 3 hp	EP3

How to Order an Electric Condensate Return or Boiler Feed Pump

Condensate Return			Boiler Feed
			
Simplex Cast Iron Tank	Duplex Cast Iron Tank	Duplex Stainless Steel Tank	Duplex Cast Iron Tank

Mechanical Alternator For Duplex Condensate Return Pump Only

Replaces the standard float switch on Duplex Condensate Return Units. Must be ordered separately.

On Duplex units, the standard float switch is replaced with a Mechanical Alternator float switch to alternate operation between the two pumps. Must be ordered separately. An Electric Alternator is also an option.

For Duplex Pumps must choose either:

A Mechanical Alternator or 2-Level Float Switch with the Electric Alternator Option on NEMA-12 Control Panel

Mechanical Alternator & Float Switches	Model Code
Mechanical Alternator - NEMA 1 (replaces Float Switch on Duplex pumps)	MECH-ALT-N1
Mechanical Alternator - NEMA 4 (replaces Float Switch on Duplex)	MECH-ALT-N4
Mechanical Alternator - Explosion Proof (replaces Float Switch on Duplex)	MECH-ALT-EP
2-Level Float Switch – (required when using an Electrical Alternator - Reference NEMA-12 Control Panel)*	FLOAT-SWITCH-2L
(Option) High-Level Auxiliary Contacts for Mechanical Alternator	CONTACTS-HLA

* 2-level float switch not required with Duplex Boiler Feed Units

Accessory Items

Condensate Return Pumps (ordered separately)	
For SIMPLEX and DUPLEX pumps	Model Code
Gauge Glass for Steel Tank	GAUGE-GLASS-ST
Gauge Glass for Cast Iron Tank	GAUGE-GLASS-CI
Isolation Valve	ISO-VALVE
Dial Thermometer	DIAL-THERM
Discharge Pressure Gauge	PRESS-GAUGE-D
Discharge Check Valve	CHECK VALVE-D
Float Switch - NEMA 4 (for Simplex Unit)	FLOAT-SWITCH-N4
Float Switch - Explosion Proof (for Simplex Unit)	FLOAT-SWITCH-EP

Boiler Feed Pumps (ordered separately)	
For SIMPLEX and DUPLEX pumps	Model Code
Isolation Valve	ISO-VALVE
Dial Thermometer	DIAL-THERM
Discharge Pressure Gauge	PRESS-GAUGE-D
Discharge Check Valve	CHECK VALVE-D

Gauge glass is standard on boiler feed pumps.

Isolation Valve

Allows pump and motor to be removed without draining condensate.

Electric Condensate Pumps

Motor Control Panel

NEMA 12 - Control Panel (for Duplex & Simplex Pumps)

Purchasing the optional motor control panel is a convenient and simple method of hooking up your pump.

For **Simplex** units, the control panel would include a single motor starter with a single HOA (HAND-OFF-AUTOMATIC) selector switch to turn the pump on manually to verify functionality; or, to set in automatic mode along with a single Motor Circuit Protector switch to shut power off to the pump.

For **Duplex** systems, the control panel would include two motor starters with two HOA (HAND-OFF-AUTOMATIC) selector switches to turn either of the two pumps on manually to verify functionality, or to set in automatic mode along with two separate Motor Circuit Protector switches to shut power off to either of the two pumps.

An Electric Alternator option can be used to replace the standard Mechanical Alternator; this option uses electronic logic as opposed to a mechanical device to cycle operation between the two pumps. If an Electrical Alternator is chosen, the Mechanical Alternator is replaced with a 2-level float switch (suffix code **E**).

Other Options, such as Pilot Light indicating when the pump is running or High Level Alarm Horn & Light indicating a flood system condition, can be added.

Control Panel Model Codes

Standard CONTROL PANEL	Simplex Model Code	Duplex Model Code
1/3 thru 5 Horsepower	CPN12-P1-S	CPN12-P1-D
Over 5 Horsepower	CPN12-P2-S	CPN12-P2-D

Standard Control Panel Includes:

- Motor Circuit Protector(s)
- HOA Selector Switch(s)
- External Reset(s)

Control Panel Options

Options	Suffix Code
UL Certification	UL
Pilot Light (Power On) (1 required per pump)	P
Test Push Button (1 required per pump)	T
Electric Alternator (for Duplex)* (2-Level Float Switch is required with Electric Alternator)	E
High-Level Alarm Horn & Light with Silencing Switch	HA
All of the Above Options	AO

Note: Standard Voltages are: 1-phase/60 Hz/115, 208, 230 VAC and 3-phase/60Hz/208, 230, 460, 575 VAC.

For non-standard voltages; consult factory.

* 2-Level Float Switch is required with Electric Alternator for Condensate Pumps Only; Not required for Boiler Feed Units.

Pilot Light

Indicates when a pump is running;
Simplex - One light; Duplex - Two Lights.

Test Push Button

Used to test if pilot light is functional. Press to test.

Electric Alternator

Uses electronic logic to alternate operation between two pumps.
This option is required for Duplex Boiler Feed systems.

For Condensate Return Systems: if an Electric Alternator is chosen instead of the Mechanical Alternator, a 2-Level Float Switch is required. (See Accessories - Electric Alternator Option. Model: **FLOAT-SWITCH-2L**)

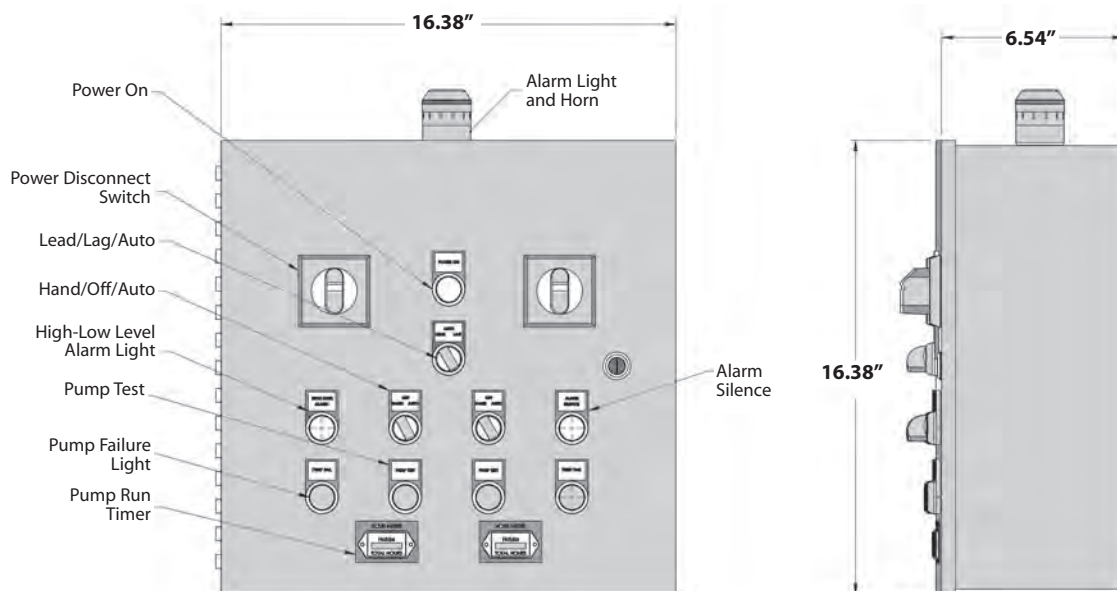

High-Level Alarm

Alarm to indicate if maximum water level is exceeded.

- Example Model Codes:**
- 1) **CPN12-P1-S** (Control Panel, NEMA 12, 1/3 thru 5 hp, Simplex, no options)
 - 2) **CPN12-P1-S-UL** (Control Panel, NEMA 12, 1/3 thru 5 hp, Simplex with UL Certification)
 - 3) **CPN12-P2-D-E** (Control Panel, NEMA 12, over 5 Hp, Duplex, with Electric Alternator)

Motor Control Panel

NEMA 12 - Control Panel (for Duplex & Simplex Pumps)

NEMA 1 - Control Panel (for Simplex Pumps Only)

For Simplex units, the NEMA 1 Control Panel will include a single motor starter with a **HOA** (HAND-OFF-AUTOMATIC) selector switch to turn the pump on manually, or to set in automatic mode. A single Motor Circuit Protector switch shuts the power off to the pump when an overload (OL) condition is detected.

- Magnetic across-the-line motor starter *
- Thermal overload and Hand-Off-Automatic (HOA) selector switch
- Optional Pilot Light

* Allows for remote start-up with full line voltage across the motor terminals.

Phase	Power	Voltage	Model Code
Single Phase	Up to 1 HP	115 VAC	MSN1-1P-1-115
	Up to 2 HP	230 VAC	MSN1-1P-2-230
	Up to 2 HP	115 VAC	MSN1-1P-2-115
	Up to 3 HP	230 VAC	MSN1-1P-3-230
Three Phase	Up to 3 HP	230 VAC	MSN1-3P-3-230
	Up to 2 HP	460 VAC	MSN1-3P-2-460
	Up to 7.5 HP	230 VAC	MSN1-3P-7-230
	Up to 5 HP	460 VAC	MSN1-3P-5-460
Option	Pilot Light		(Suffix Code) P

Example Model Codes:

- 1) **MSN1-1P-1-115** (Motor Starter, NEMA 1, single-phase, 1 HP, 115 VAC)
- 2) **MSN1-3P-3-230-P** (Motor Starter, NEMA 1, three-phase, 3 HP, 230 VAC with Pilot light)

Pilots for HD Regulators

226-248

PP & PP5-Pressure Pilots	Spring-loaded pressure pilots for general service steam pressure reducing.	226
PBP-Back Pressure Pilot	For controlling upstream pressure of the HD Regulator.	228
PT-Temperature Pilot	General purpose liquid-filled temperature pilot used when heating liquids to a desired temperature.	230
PA-Pressure Pilot (Air-Loaded)	Air-loaded Pressure Pilot can be used instead of spring-loaded PP pilots for pressure regulation in remote installations. Also used in conjunction with PTR & PTL temperature controllers.	234
PS-Solenoid Pilot	Solenoid Pilot can be used in conjunction with any of the listed pilots for electrical on/off control of HD Regulators.	238
PTR & PTL Temperature Controllers	These temperature controllers have a wider temperature span than the PT temperature pilot. They are used in conjunction with the PA-Air Pilot to deliver an air signal to the HD valve.	240
PTRP Temperature Pilot	Special purpose vapor tension temperature pilot for increased sensitivity	242
TSP-Pilot	The Trip Stop Pilot is used to prevent over pressurization of downstream steam piping systems, and reduced reaction time when controlling temperature of liquids and air.	246
PDP-Pilot	Differential Pressure Pilot with two separate sensing ports for maintaining differential pressure between steam and an alternate medium.	247
EP-Pilot	The Electric Pilot is used with HD regulators for a variety of applications including on/off control and slow system warm-up.	248

HSP & HSP-SS Series Pressure Regulators • Cast Steel • Stainless Steel 250

The Watson McDaniel HSP Pilot-Operated Pressure Regulating Valve is constructed of Cast Carbon Steel for higher pressure and temperature ratings when compared to ductile iron. The HSP-SS is constructed of Stainless Steel for increased corrosion resistance.

Available with other pilots such as Temperature, Electric, Back Pressure, Trip-Stop, etc.

258

DL Series Pressure Regulators • Ductile Iron • Cast Steel • Stainless Steel 260

The Watson McDaniel DL Series Dome-Loaded Regulator is used mainly to Reduce Steam Pressure. No pilot is needed as it can be direct-loaded with air or inert gas for simple and accurate control of downstream steam pressure.

Available in Ductile Iron, Carbon Steel, or Stainless Steel as well as other options for steam pressure control.

The **HD-Series Pilot-Operated Regulators** are used on steam applications for pressure reduction or controlling product temperature (when steam is used in heating applications). The Pilot-operated regulators are more accurate and available in higher capacity than Direct-Operated regulators. The HD Series regulators use a pilot valve (several types and styles including Pressure, Temperature, ON-OFF solenoid, etc) to control the operation of the Main Valve. The HD series has a Ductile Iron Body; Pilot and Main-Valve are selected separately.

The **HSP Pressure Regulator** has a Cast Carbon Steel body; standard is with pressure pilot. Other pilots available; Consult factory.

1) Select HD Main Valve →

The HD Series Pilot-Operated Regulating Valves are used for controlling pressure and temperature in industrial and HVAC steam applications.

Model: PP

Typical Applications

- Pressure Regulating
- Temperature Regulating
- Pressure-Temperature Control
- Back Pressure Control
- Differential Pressure Control

Combination Pilots

The HD-Series Steam regulating valve can be used with up to three pilots simultaneously to control the operation of the valve. An example is when steam is used to heat water in a Heat Exchanger. The Temperature Pilot will maintain precise control of outlet water temperature by controlling the amount of steam flow through the valve while a Pressure Pilot limits the maximum outlet steam pressure of the regulator to the Heat exchanger. A third pilot (Solenoid pilot) can be added to electrically activate or de-activate the system.

HD Pilot-Operated Regulating Valve

Introduction • Typical Applications

HD Main Valve

with
PP-Pressure Pilot

Reducing Pressure

Several choices of pilot valves can be used for pressure reduction on steam applications. The opening of the pressure pilot controls the operation of the Main Valve. The PP & PP5 are referred to as spring loaded pressure pilots because an adjustable control spring is used to apply the opening force to the pilot valve. Pressure adjustment screw is located on top of pressure pilot. The PA pilot is referred to as an Air Loaded pressure pilot because Air Pressure is used to apply the opening force to the pilot valve. The PA pilot allows for convenient and remote adjustment of steam pressure using a small air regulator.

Pilot-Operated
REGULATORS

HD Main Valve

with
PT-Temperature Pilot

Controlling Temperature

When steam is used on heating applications, several choices of pilots are available. The PT pilot (most common) is referred to as a "solid liquid fill" and contains a temperature probe connected by a length of capillary tubing to a bellows in the pilot valve. When the temperature bulb is heated the liquid inside the probe expands the bellows and closes off the pilot valve. PTRP pilot operates in a similar fashion except this style is referred to as a vapor tension unit.

The PTL temperature controller uses a bi-metal element to sense temperature and deliver an appropriate air signal to a PA air pilot that controls the operation of the HD main valve.

HD Main Valve

with
PP-Pressure Pilot
and
PT-Temperature Pilot

Controlling Temperature & Limiting Pressure to a Maximum Value

The PT & PP Pilot combination is used when it's required to control **temperature** while limiting **downstream pressure** to a maximum value. When the PT & PP Pilot combination is used, the downstream pressure is limited to a maximum setting by the pressure pilot, while the temperature pilot maintains the correct temperature of the process.

Features of the HD Regulating Valve

- No external power source is required.
- Pressure & temperature pilots can be used in combination, eliminating the need for a separate pressure and temperature regulator.
- Ductile iron body for higher pressure ranges and increased safety when compared to cast iron.
- Full port strainer and blowdown valve on pilot adapter for ultimate protection against dirt and scale.
- Hardened stainless steel trim (55 Rc) for extended life even in the most demanding applications.
- The innovative design allows the pilot to be mounted on either side of the regulator and is easily field-reversible without having to rebend tubing.
- Tubing and pilot adapter is pre-mounted on main valve. The control pilot requires only four bolts to complete the installation.

HD Pilot-Operated Regulating Valve

Introduction

Typical Configurations

The **HD Series Pilot-Operated Regulating Valve** was designed for extremely accurate control of temperature and pressure in steam service applications. The HD-Series is made of Ductile Iron for extended pressure and temperature ratings when compared to cast iron. Several different control pilots can be mounted to the valve to control pressure, temperature, or a combination of both. When two or more pilots are used together (both a pressure and a temperature pilot) an additional pilot adapter for the second pilot is required (must indicate when ordering). The most common pilots are the PP-Pilot for pressure reducing, and the PT-Pilot for temperature control. **The Standard Main Valve** is used for an inlet steam pressure range of 15-300 PSI. The **Low-pressure Main Valve** contains a different main valve spring and is available for an inlet pressure range of 5-20 PSI. The Main Valve and Pilot are purchased separately.

Pressure Control

When controlling pressure, there are several options you can use for a pilot. The **PP**-Pilot and the **PP5**-Pilot are both **spring-adjusted** pressure pilots. The **PP**-Pilot is used on general-purpose pressure reducing applications and the **PP5**-Pilot is used when higher accuracy is required. The **PA**-Pilot is air controlled and allows for easier and remote adjustment of steam pressure.

Temperature Control

Several choices of pilot valves can be used for temperature control when steam is used on heating applications. The **PT** style pilot (most common) is referred to as a "solid liquid fill" and contains a temperature probe connected by a length of capillary tubing to a bellows in the pilot valve. When the temperature bulb is heated the liquid inside the probe expands the bellows and closes off the pilot valve. **PTRP** pilot operates in a similar fashion except this style is referred to as a vapor tension unit.

The **PTL** temperature controller uses a bi-metal element to sense temperature and deliver an appropriate air signal to a **PA** air pilot that controls the operation of the HD main valve.

Temperature-Pressure Control

The **PP & PT**-Pilot combination is used when it is desirable to control both the **pressure** and **temperature** of a system with only one regulating valve. The unique features of this modular valve allow this to be accomplished quite easily. When the **PP & PT**-Pilot combination is used, the downstream pressure is limited to a maximum setting by the pressure pilot, while the temperature pilot maintains the correct temperature.

On-Off Operation

Electrical **On-off control** of the regulator is possible by using the **PS**-Solenoid Pilot or **EP** Electric Pilot. The **PS**-Pilot allows the regulator to be shut off or turned on **electrically**. Normally the regulator is equipped with either a **PP**-Pressure Pilot or **PT**-Temperature Pilot in addition to the **PS**-Solenoid Pilot. The **EP** Electric Pilot can be used for a variety of applications including pressure control, on-off, as well as slow system start-up.

Trip-Stop Pressure

The **TSP-Trip Stop** Pilot is used to prevent over pressurization of downstream steam piping systems.

Back Pressure

When controlling the back pressure in a steam system, the **BP**-Pilot is used in conjunction with the **HD-Series** Regulator. This controls the pressure on the upstream side of the regulator.

Differential Pressure

The **PDP**-Pilot is used when trying to balance two different media sources that are being blended.

Stainless Diaphragm Option

The HD regulator is supplied standard with a high tensile strength Phosphor Bronze diaphragm which has been determined thru experience and testing to be the absolute best diaphragm material choice for steam applications. Stainless Steel diaphragms are offered as an option because certain industry specifications have been written requiring stainless steel. Note: Stainless steel is prone to work hardening and will not last as long as phosphor bronze; only use if required by the specification to do so.

Stainless Tubing Option

Copper tubing is supplied as standard. Copper tubing offers excellent corrosion resistance and is easy to bend and manipulate and normally outlasts the life span of the valve. Stainless Steel tubing is offered as an option.

Reduced port trim Option:

Regulators should be sized to meet the application not to fit the pipe size. Over sizing a regulator may cause overshoot which leads to erratic pressure or temperature control often referred to as "hunting." A valve with reduced port trim has a reduced seat and disc size for a given pipe size, (refer to capacity charts).

Low pressure (differential and inlet) Option:

Regulators require a minimum Inlet pressure as well as a minimum pressure drop across the valve to operate properly. The HD Standard Main valve requires a minimum inlet pressure of 15 PSIG and minimum differential pressure of 10 PSI. The Low Pressure Main valve requires 5 PSIG minimum inlet pressure and 3 PSI minimum differential pressure. Low pressure main valve uses a EPDM diaphragm.

HD Main Valve with PP-Pressure Pilot Spring-Loaded

Shown with **PP** Pressure control Pilot. Spring-loaded pressure pilots are the most typical method of controlling downstream pressure in Steam Systems. Adjustment screw on top of pilot controls downstream steam pressure.

HD Main Valve with PT-Temperature Pilot

Shown with Temperature control Pilot: The **PT** Temperature Pilot will control the flow of steam flowing through the HD valve based on the temperature of the sensing bulb. The liquid-filled sensing Bulb is available in standard 8 ft and 15 ft capillary lengths. Other lengths available.

HD Main Valve with PA-Pressure Pilot Air-Loaded

Shown with Air-loaded pressure control pilot. Air-loaded pressure pilots are used to reduce and control pressure in steam systems. They are used as an alternative to the more common spring-loaded pilot. The **PA** Air-loaded pressure pilot allows for remote adjustment of the valve using a small air regulator to alter the air pressure to the top of the pilot.

HD Main Valve with PS On/Off Control Solenoid Pilot

Shown with **PS ON-OFF**(solenoid Pilot) control pilot: The **PS ON-OFF** (solenoid) Pilot allows for the HD valve to be opened and closed using an electrical switch to activate a small solenoid valve. The **PS** Pilot can be used for system automation or as a safety shut down device. The ON-OFF pilot is most often used in conjunction with a Pressure or Temperature control pilot.

HD Pilot-Operated Regulating Valve

HD Regulator & Pilot Combinations

HD Main Valve

with

- **PT-Temperature Pilot**
- **PP-Pressure Pilot**

The **PT** Temperature Pilot will maintain the proper flow of steam through the main valve to keep the process it's controlling at the proper temperature. The **PP** pressure Pilot will **LIMIT** the downstream pressure to a maximum value. This combination of Pilots is very convenient when the Steam Pressure in the supply line is greater than the maximum pressure allowed to the process heat exchanger. This eliminates using a separate Pressure reducing valve prior to the temperature control valve.

NOTE: When two or more pilots are used on the same valve: An additional Pilot Adapter for Second Pilot is required: Use part number: **BADAPTER**

HD Main Valve

with

- **PP-Pressure Pilot**
- **PS1 On/Off Control Solenoid Pilot**

The **PP** Pressure Pilot will maintain the desired downstream set pressure as long as the **PS ON-OFF** (solenoid) Pilot is in the ON position. Available in either Normally-ON or Normally-OFF configuration; an electrical signal turns valve OFF or ON.

HD Main Valve

with

- **PT-Temperature Pilot**
- **PS1 On/Off Control Solenoid Pilot**

The **PT** Temperature Pilot will maintain the proper flow of steam through the main valve to keep the process it's controlling at the proper temperature as long as the **PS ON-OFF** (solenoid) Pilot is in the ON position. Available in either Normally-ON or Normally-OFF configuration; an electrical signal turns valve OFF or ON.

HD Main Valve

with

- **PP-Pressure Pilot**
- **PT-Temperature Pilot**
- **PS1 On/Off Control Solenoid Pilot**

The **PT** Temperature Pilot will maintain the proper flow of steam through the main valve to keep the process it's controlling at the proper temperature as long as the **PS ON-OFF** (solenoid) Pilot is in the ON position. The **PP** Pressure Pilot will **LIMIT** the downstream pressure to a maximum value.

NOTE: When two or more pilots are used on the same valve: An additional Pilot Adapter for Second Pilot is required: Use part number: **BADAPTER**

Pilot-Operated
REGULATORS

Pressure Regulating with PP & PP5 Spring-loaded Pilot

Pressure Pilot	(Standard: 1.0 psig accuracy) (High-accuracy: 0.5 psig accuracy)	PP PP5
Pilot Body Material		Cast Steel
Max Inlet Pressure		300 PSIG
Reduced Outlet Pressure Range		3-200 PSIG
Inlet Pressure Range (with HD Standard main valve)		15-300 PSIG
(with HD Low-Pressure (LP) main valve)		5-20 PSIG
Minimum Differential Pressure (with HD Standard main valve)		10 PSI
(with HD Low-Pressure (LP) main valve)		3 PSI

Typical Applications

The **PP & PP5 Pressure Pilots** are used with the HD Regulator to control steam pressure in steam mains or for process equipment. Pilot-operated regulators maintain constant downstream pressure even when the inlet pressure to the valve fluctuates or steam usage varies. The PP-Pressure Pilot is adequate for controlling pressure in most industrial applications. For increased accuracy use the PP5 Pilot.

PP-Pressure Pilot (Standard) 1.0 PSIG accuracy

PP5-Pressure Pilot (Special Applications) 0.5 PSIG accuracy

Features

- The **PP**-Pilot can maintain downstream pressure to ± 1 PSIG
- **PP5**-Pilot can maintain downstream pressure to ± 0.5 PSIG
- Choices of three overlapping pressure ranges
- Pilot is easily installed on pilot adapter using four bolts, no tubing connections are required
- Full port strainer and blowdown valve on pilot adapter for protection of pilot from dirt and scale
- Solid floating diaphragm is more failure resistant
- Watson McDaniel's pilots can be used with other manufacturers' regulators

Options

- Pressure pilot can be used with temperature pilot to eliminate the need for two separate regulators
- Solenoid pilot can be added for remote on/off control of regulator

Example: PP-B Pilot at 20-100 PSIG

Reduced Pressure Range PSI	Model Code	Spring Color	Weight lbs
PP-Pressure Pilot (for Standard Industrial Applications) 1.0 PSIG accuracy			
3-25	PP-Y	Yellow	10
20-100	PP-B	Blue	10
80-200	PP-R	Red	10
PP5-Pressure Pilot (Special Applications) 0.5 PSIG accuracy			
1-10	PP5-Y*	Yellow	25
10-25	PP5-B*	Blue	25

* A Spacer (model # BAP-SPACE) is required when using PP5 Pressure Pilots on a 3" & 4" HD Main Valve.

Pressure Regulating with PP & PP5 Spring-loaded Pilot

Reducing Pressure

The **PP-Pilot** and the **PP5-Pilot** are both **spring-adjusted** pressure pilots. The **PP-Pilot** is used on typical general-purpose pressure reducing applications. The **PP5-Pilot** is used when higher accuracy is required and is capable of maintaining a control pressure window of less than 1 PSI.

How it Works

The Pressure Pilot controls the operation of the HD Regulator. The sensing line connects the pressure pilot to the downstream side of the regulator. Pressure in the sensing line applies an upward force to the pilot diaphragm to compress the adjustment spring. When system pressure equals set point, the diaphragm moves upwards against the force of the adjusting spring, closing pilot valve. When the pilot valve is shut, steam cannot pass thru to the underside of the regulator diaphragm, closing the regulator. When the pilot valve falls below its set point, the pilot valve opens allowing steam to lift the main valve diaphragm which opens up the regulating valve.

DIMENSIONS HD-Series – inches									
Size	Face-To-Face							Weight (lbs)

For PP5 Pilot: * For sizes 1/2" to 1¹/₂" add 2¹/₂" to "C" dimension;
For sizes 2" to 6" add 5" to "C" dimension.
** Add 1¹/₂" to "E" dimension for all sizes.

Back Pressure Regulating with PBP Back-Pressure Pilot

Back Pressure Pilot	PBP
Pilot Body Material	Cast Steel
Max Inlet Pressure	300 PSIG
Reduced Outlet Pressure Range	10-200 PSIG
Inlet Pressure Range (when used with HD Standard main valve)	15-300 PSIG
Inlet Pressure Range (when used with HD-LP Low-Pressure main valve)	5-20 PSIG

Minimum Differential Pressure:

10 PSI (Standard Main Valve)

3 PSI (Low Pressure Main Valve)

Typical Applications

The **PBP-Back Pressure Pilot**, used with the **HD** regulator, maintains upstream pressure in steam systems. These regulators are commonly used to supply flash steam to low pressure mains.

Features

- The PBP-Pilot can maintain upstream pressure to ± 1 PSIG
- Choices of three overlapping pressure ranges
- Pilot is easily installed using four bolts. No tubing connection required
- Full port strainer and blowdown valve on pilot adapter for protection of pilot from dirt and scale
- Solid floating (no penetration hole) pilot diaphragm resists failure
- Watson McDaniel's pilots can be used with other manufacturers' regulators

Option

- Can be used with solenoid pilot for on/off control

Reduced Pressure Range PSI	Model Code	Spring Color	Weight lbs
10-25	PBP-Y	Yellow	10
20-100	PBP-B	Blue	10
80-200	PBP-R	Red	10

Units: inches

OPERATING PRESSURES

Inlet Pressure Range:

15-300 PSIG (Standard Main Valve)

5-20 PSIG (Low Pressure Main Valve)

Minimum Differential Pressure:

10 PSI (Standard Main Valve)

3 PSI (Low Pressure Main Valve)

Back Pressure Regulating with PBP Back-Pressure Pilot

Back Pressure

The **PBP** Back-Pressure Pilots are used with HD Regulators to maintain upstream pressures in steam systems. When the upstream pressure reaches the pilot set point, the regulator opens. The HD Regulator with a PBP Back-Pressure Pilot is commonly used to supply steam to low-pressure mains. The PBP Back-Pressure Pilot maintains a constant back-pressure on the inlet side of the regulator. Should not be used in place of a safety relief valve.

HD Main Valve with PBP-Pressure Pilot

Model Code for Main Valve: **HD-17-F150**
(2" HD Series Valve with 150# Flanges)

Model Code for Pilot: **PBP-B**
(Back-Pressure Pilot with 20-100 PSIG Range)

Temperature Regulating with PT Temperature Pilot

Temperature Pilot	PT
Pilot Body Material	Cast Steel
Max Inlet Pressure	300 PSIG
Temperature Control Range	60-300°F
Steam Inlet Pressure Range (Standard) (when Standard Temperature Pilot is used with HD Standard main valve)	15-300 PSIG
Steam Inlet Pressure Range (Low) (when Low-Pressure Temperature Pilot is used with HD-LP Low-Pressure main valve)	5-20 PSIG

Typical Applications

The PT-Temperature Pilots are used with the HD regulator to control temperature in various processes and systems. Some examples are: oil heaters, ovens, process heaters, vats, dryers and jacketed kettles. Thermostatic sensing bulb comes with standard 8-ft. or 15-ft. capillary lengths. Temperature adjustment is accomplished by rotating an adjustment knob to the desired temperature setting.

The **HD** Regulator can be used with both the **PP-Pressure Pilot** and **PT-Temperature Pilot** simultaneously to limit pressure and control temperature in process applications.

Using both the temperature and pressure pilots on the same regulator eliminates the need for two separate regulators to control temperature and pressure.

Features

- Temperature adjustment made simple and easy by rotating an adjustment knob to the desired temperature setting
- Thermostatic sensing bulb comes with an 8-ft. or 15-ft. length capillary
- Capillary is armor-protected to resist damage
- Overheat protection bellows is incorporated into sensing bulb; 200°F overheat protection up to 350°F
- Full port strainer and blowdown valve on pilot adapter for protection of pilot from dirt and scale

Options

- Temperature Pilot can be combined with Pressure and Solenoid pilots
- Capillary lengths up to 25-ft. maximum
- Thermowells* for isolating sensing bulb from process liquid are available in brass or 316 stainless steel
- Extended length wells available for increased insertion depth of sensing bulb
- 316 Stainless Steel Sensing Bulb

LOW PRESSURE PT Pilot (pressures under 15 PSIG)

Use Code **LP**: Low pressure Temperature Pilot is required for steam pressure under 15 PSI. (Range 5 - 20)

PILOT: Example Model Code: **PTU-12-8-LP**

LOW PRESSURE HD Main Valve (pressures under 15 PSIG)

Use Code **LP**: A Low Pressure Main Valve must be used in conjunction with a Low Pressure Temperature Pilot for steam pressure under 15 PSIG (Range 5 - 20)

MAIN VALVE: Example Model Code: **HD-13-N-LP**

Options & Adders:

Code **LP** - Low Pressure Pilot

Code **20** 20 ft. Capillary Length

Code **25** 25 ft. Capillary Length

Example: **PTU-29-8** (with standard 8 ft capillary) is changed to 20 ft of capillary. Model code becomes **PTU-29-20**

Code **SSBBAC** - *SS bulb, bushing & 8 ft. armored capillary

*Note: The standard sensing bulb is copper. A 316 SS Bulb and bushing with 8 ft. armoured capillary is available for corrosive applications or to meet SWDA requirements. Use code **SSBBAC**

For Temperature Pilot

Temperature Ranges	
60 - 120°F	(16 - 49°C)
100 - 160°F	(38 - 71°C)
120 - 180°F	(49 - 82°C)
160 - 220°F	(71 - 104°C)
200 - 260°F	(93 - 127°C)
240 - 300°F	(116 - 149°C)

Model Codes for Individual Thermowells for PT & PTU Pilots

Model Code	Description of Thermowell
WELL-TU-BR	Brass Thermowell for PTU pilot
WELL-TU-SS	Stainless steel Thermowell for PTU pilot
WELL-T-BR-EXT	Extended brass Thermowell for PT pilot
WELL-T-SS-EXT	Extended stainless steel Thermowell for PT pilot

* Thermowells:

Wells isolate sensing bulb from the process liquid and are available in Brass or Stainless Steel. When placed on the side of a tank or vessel, the sensing bulb can be removed without having to drain the process fluid.

All Sensing Bulbs are Copper

Dimension (inches)

PT

Plain copper sensing bulb that is directly immersed into the fluid. Normally the PT bulb type is lowered down vertically into the top of a tank or vat to a desired vertical insertion depth.

PTU

Copper sensing bulb with Union connection allowing it to be screwed into the side of a tank or pipe. The sensing bulb is in direct contact with the process fluid. Sensing bulb can be removed by unscrewing union nut (union hub remains in place).

PTUBW & PTUSW (PTU style copper sensing bulb with Thermowell)

PTUBW: Brass Well
PTUSW: 316L SS Well

The Isolation Well, which isolates the copper sensing bulb from the process fluid, is available in either Brass or 316L Stainless Steel. Sensing bulb can be removed by unscrewing union nut. Union Hub & Isolation Well remain in place which allows the removal of the sensing bulb without having to drain the tank. Stainless Steel Isolation Wells are used to protect the copper sensing bulb from corrosive fluids. Brass wells have better heat transfer.

PTBW & PTSW (PT style copper sensing bulb with Extended Length Thermowell)

PTBW: Brass Well
PTSW: 316L SS Well

For deeper & variable insertion depths into tanks or vats; up to 18" deep. The extended length Isolation Well isolates the copper sensing bulb from the liquid and allows the copper sensing bulb insertion depth to be adjusted to a depth of up to 18". They are available in either Brass or 316L Stainless Steel. Isolation Well remains in place which allows the removal of the sensing bulb without having to drain the tank.

Example Model Codes:

PT-14-15	PT Plain Sensing Bulb (no threaded connection), 100-160 °F, 15 Ft. Capillary Length
PTUBW-30-8	PTUBW Sensing Bulb with Threaded Union Connection & Brass Well, 160-220 °F, 8 Ft. Capillary Length
PTBW-31-20-LP	PTBW Plain Sensing Bulb with Extended Brass Well, 200-260 °F, 20 Ft. Capillary Length with Low Pressure Option

Model Code Configuration for Temperature Pilot

Example Model: **PTBW-31-8-LP**

Bulb Type	Code	Temperature Range	Code	Capillary Length	Code	Options (Suffix)
PT	12	60°F - 120°F	8	8 Feet	LP	Low Pressure (required under 15 PSI)
PTU	14	100°F - 160°F	15	15 Feet	SSBAC	SS bulb, bushing & armored capillary
PTUBW	29	120°F - 180°F	20	20 Feet		
PTUSW	30	160°F - 220°F	25	25 Feet		
PTBW	31	200°F - 260°F				
PTSW	32	240°F - 300°F				

Temperature Regulating with PT Temperature Pilot

PT Pilot Dimensions

Controlling Temperature of a large Tank of Water using PT-Temperature Pilot

HD Main Valve

with

PT-Temperature Pilot

Controlling Temperature

PT-pilot is used for temperature control when steam is used on heating applications. The PT style pilot is a "solid liquid fill" design made up of a temperature probe connected by a length of capillary tubing to a bellows in the pilot valve. When the temperature bulb is heated the liquid inside the probe expands the bellows and closes off the pilot valve. The opening and closing of the pilot controls the flow of steam thru the main valve; which maintains system temperature. PT-pilot controls temperature through a range of 60-300°F.

An overheat protection bellows is incorporated into sensing bulb.

Controlling Temperature and Limiting Pressure using PT-Temperature Pilot & PP-Pressure Pilot

HD Main Valve

with

- PP-Pressure Pilot
- PT-Temperature Pilot

Controlling Temperature & Limiting Pressure to a Maximum Value

The PT & PP Pilots combination is used when it's required to control **temperature** while limiting **downstream pressure** to a maximum value. When the PT & PP Pilots combination is used, the downstream pressure is limited to a maximum setting by the pressure pilot, while the temperature pilot maintains the correct temperature of the process. This eliminates the need for a separate pressure reducing valve.

Minimum Differential Pressure:

10 PSI (Standard Main Valve)

3 PSI (Low Pressure Main Valve)

Note: Temperature Range: 0-350°F when used with PTL & PTR temperature controllers

Pilot-Operated REGULATORS

Typical Applications

The **PA Air-Loaded Pressure Pilot** is used with the **HD Regulator** to control steam pressure on steam mains and process equipment. The principal advantage the **PA-Air Pilot** has over standard spring-loaded pilots is that pressure adjustments to the regulator can be made from a remote location. A regulator that is located in a difficult to reach or inaccessible location can be adjusted by a remote control panel board. The **PA-Air Pilot** can also be used in conjunction with the **PTL** or **PTR** pneumatic temperature controllers for controlling temperature in process applications.

How it Works

When air pressure is applied to the upper chamber of the air pilot it exerts a downward force on the air pilot's diaphragm. This force controls the outlet pressure of the steam through the regulating valve. The control process is similar to a spring loaded pressure pilot except that the air pressure takes the place of the spring. There are three separate models of air pilots that make up the complete range depending on the steam pressure that needs to be controlled and the control air pressure available. See Pressure Adjusting Ranges chart.

Features

- Pressure adjustments to the regulator can be done from a remote location using an air signal
- Air-operated pilot ensures instant response and extremely accurate control
- Full port strainer and blowdown valve on pilot adapter for protection of pilot from dirt and scale
- Controls pressure settings within ± 1 PSIG

DIMENSIONS – inches

Model	A	B
PA1	5 ¹ / ₄	5
PA4	5 ¹ / ₄	7 ⁷ / ₈
PA6	5 ¹ / ₄	9 ¹ / ₂

Model PA1
(Pilot shown)

HD Main Valve
with PA4 Pilot

MAXIMUM CONTROL AIR PRESSURE ON AIR PILOT IS 125 PSIG

PRESSURE ADJUSTING RANGES		
Model	Pressure Ranges	Description
PA1	3-125 PSIG	1:1 ratio of steam pressure to control air pressure
PA4	3-200 PSIG	4:1 ratio of steam pressure to control air pressure
PA6	20-200 PSIG	6:1 ratio of steam pressure to control air pressure

The larger Diaphragm area of the **PA4 & PA6** Air Pilots allow the use of lower control air pressure to regulate higher pressure steam.

Pressure Control with **PA Air-Loaded Pressure Pilot**

Pressure Reducing Station Using HD Regulator with an Air Pilot

**Pilot-Operated
 REGULATORS**

Description of Operation

The **PA-Air Pilot** is being used in conjunction with the **PL2 Control Panel Board** to regulate steam pressure. A small air regulator on the panel board can be adjusted to control the air pressure to the pilot. One gauge on the panel board measures air line pressure to the panel board and the other gauge shows the air pressure being sent to the pilot. Steam pressure at the outlet of the regulator is controlled by the air pressure signal to the pilot. Depending on the air pilot model chosen (**PA1**, **PA4**, **PA6**), there will be a 1:1, 4:1, or 6:1 ratio of outlet steam pressure to air pressure.

REMOTE CONTROL PANEL BOARDS

Three different options of remote control panel boards can be used along with the Air Pilots. Supply air is fed directly through the control panel board to the air pilot. You can choose one of the three options of control panel boards when using the air piloted regulators. Minimum of 5 PSIG air supply pressure is required.

PL1

PL2

PL3

PL1

The **PL1** is made up of an air pressure regulator with adjustment knob and pressure gauge that measures the amount of air pressure going to the pilot (air signal). Steam pressure of the system is controlled by adjusting the air pressure regulator.

PL2

The **PL2** is the same as the PL1 with the addition of an extra air pressure gauge for measuring the air supply pressure to the control panel board.

PL3

The **PL3** is the same as the PL2 with the addition of a Steam Pressure Gauge for measuring steam pressure on the outlet side of the regulating valve.

Pressure Control with **PA Air-Loaded Pilot**

How it Works

When air pressure is applied to the upper chamber of the air pilot, it exerts a downward force on the air pilot's diaphragm. The lower chamber of the air pilot is connected to the outlet side of the regulator using a sensing line. The purpose of the sensing line is to sense the pressure on the outlet side of the regulator and direct it under the lower pilot diaphragm to push it upwards. When the intended set pressure is reached, the pilot valve closes, which then closes off the flow path of steam to the underside of the diaphragm chamber in the regulator body. The regulator modulates open and closed maintaining the desired downstream pressure. To change downstream pressure, increase or decrease air pressure to pilot accordingly.

Pilot-Operated
REGULATORS

MAXIMUM CONTROL AIR PRESSURE ON AIR PILOT IS 125 PSIG

PRESSURE ADJUSTING RANGES		
Model	Pressure Ranges	Description
PA1	3-125 PSIG	1:1 ratio of steam pressure to control air pressure
PA4	3-200 PSIG	4:1 ratio of steam pressure to control air pressure
PA6	20-200 PSIG	6:1 ratio of steam pressure to control air pressure

The larger Diaphragm area of the **PA4 & PA6** Air Pilots allow the use of lower control air pressure to regulate higher pressure steam.

OPERATING PRESSURES

Inlet Pressure Range:

15-300 PSIG (Standard Main Valve)

5-20 PSIG (Low Pressure Main Valve)

Minimum Differential Pressure:

10 PSI (Standard Main Valve)

3 PSI (Low Pressure Main Valve)

CONTROL AIR PRESSURE RANGE

A-Pilot Control Pressure:

3-125 PSIG (depending on pilot selected and desired outlet pressure)

HD Main Valve

with PA-Pressure Pilot Air-Loaded

Model Code for Main Valve: **HD-17-F150**
(2" HD Series Valve with 150# Flanges)

Model Code for Pilot: **PA4**
(Air Pilot, 4:1 ratio of steam pressure to control air pressure)

How to Size / Order

PA - AIR PILOT

Specify:

- Air Pilot **PA1**, **PA4** or **PA6**
- Remote Control Panel Board **PL1**, **PL2** or **PL3**

REGULATOR BODY

Specify:

- **HD** regulator body
- Regulator size or capacity and pressure range of steam required
- End connections (threaded, 150/300# flanged)

On/Off Control using an Electric Solenoid

- Max Inlet Pressure: 250 PSIG

Solenoid Pilot (Electric)	PS1 & PS2	
Pilot Body Material	Cast Iron	
Valve Head & Seat	Stainless Steel	
Max Inlet Pressure	250 PSIG	
Pressure Range		
PS1	15-180	PSIG
PS2	180-250	PSIG
PS1-LP	0-20	PSIG

Typical Applications

Typically used for automatic operation, remote control, programmed cycling, sequential function interlocks with other equipment, and emergency shut-off in case of power failure.

How it Works

The **PS-Solenoid Pilot** can be used in conjunction with Pressure, Temperature, or Air Pilots to electrically control on/off operation of the **HD Regulator**. When the solenoid pilot is used, the regulator can be turned on or off by electrically activating or de-activating the solenoid.

Normally Closed (NC) – Standard

The normally CLOSED Solenoid Pilot remains closed in the non-activated state. The regulating valve will remain closed until an electrical signal is sent to the solenoid pilot. The signal is required to allow the regulator to operate. This is known as a fail-safe condition.

Normally Open (NO) – Optional

The normally OPENED Solenoid Pilot remains open in the non-activated state. The regulating valve will function normally unless an electrical signal is used to shut off the solenoid pilot.

Features

- Available normally opened (NO) or normally closed (NC)
- Full-port strainer and blow-down valve on pilot adapter to eliminate failure caused by contaminated steam systems

Options

- Normally open solenoid
- NEMA Ratings: NEMA 4 and NEMA 7
- Voltage: 24 VAC*, 120 VAC, 240 VAC

Model Code Configuration Chart

Models	Pressure PSI	Code	Voltage	Code	Action	Code	Rating
PS1	15-180 PSIG	24	24 VAC*	NC	Normally Closed (Standard)	N4	Standard. Meets enclosure Type 4 (water proof).
PS2	180-250 PSIG	120	110 -120 VAC	NO	Normally Open (special order)	N7	Meets NEMA 4 & 7 Rating (water proof & explosion proof)
PS1-LP	0-20 PSIG	240	220 - 240 VAC				

* Note: Max. PMO with 24 VAC is 50 PSIG

Standard Solenoid Pilots Available

Steam Inlet Pressure	0-180 PSIG 180-250 PSIG
NEMA Ratings	NEMA 4 – Waterproof (standard) NEMA 7 – Explosion-proof (optional)
Voltage	24 Volts AC* 110-120 Volts AC 220-240 Volts AC
Control Action	Normally Closed (standard) Normally Open (special order)

Model Code	PMO PSIG	Weight lbs
PS1	15-180	4.5
PS2	180-250	5.5
PS1-LP	0-20	4.5

Use PS1-LP for Low Pressure applications under 15 PSI.

Example Model Codes:

- 1) **PS1-120-NC-N4** NEMA 4 (standard)
- 2) **PS1-120-NC-N7** NEMA 4 & 7 (waterproof & explosion proof)

(mounts remotely with 4-ft. capillary)

Typical Applications

The **PTL** and **PTR** Pneumatic Temperature Controllers operate over a wider temperature range and react faster than our standard **PT** temperature pilot. This makes them a preferable choice for instantaneous hot water applications.

How it Works

The **PTL** and **PTR** Pneumatic Temperature Controllers are used in conjunction with a **PA-Air Pilot** to control the operation of the **HD Regulator**. The **PTL** uses a bi-metallic element to sense temperature and the **PTR** uses a hydraulically-filled bulb (with 4-ft. capillary) to sense temperature. The air supply is connected to the inlet of the controller and the air output signal is fed directly to an Air Pilot, which controls the opening and closing of the steam regulating valve.

Features

- Accurate and rapid response to temperature changes
- Temperature control range of 0-350 °F

Model Code	Product Description Bulb & Capillary	Capillary Length	Weight lbs
PTL-E7	Pneumatic temperature controller, direct mount	N/A	5.3
PTR-E8	Pneumatic temperature controller, remote mount	4'	3.0

for **PTL & PTR**
Pneumatic
Temperature
Controller,
Air Pilot is required

OPERATING PRESSURES

Inlet Pressure Range:

- 15-300 PSIG** (Standard Main Valve)
- 5-20 PSIG** (Low Pressure Main Valve)

Minimum Differential Pressure:

- 10 PSI** (Standard Main Valve)
- 3 PSI** (Low Pressure Main Valve)

How to Size / Order

PTL & PTR PNEUMATIC TEMPERATURE CONTROLLER

Specify: • **PTL** or **PTR** controller model (air pilot required for operation)

AIR PILOT

Specify: • **PA1**, **PA4** or **PA6** Air Pilot model (refer to Air Pilot section)

REGULATOR BODY

Specify: • **HD** regulator body
• Regulator size or capacity
• End connections (threaded, 150/300# flanged)

Pneumatic Temperature Controllers (must be used with PA-Air Pilot)

Description of Operation

The **PTL Pneumatic Temperature Controller** senses outlet water temperature on a semi-instantaneous hot water heater. When the outlet water temperature falls below the set point, the PTL pneumatic temperature controller sends an air signal to the **PA Air Pilot**, which opens the regulator, allowing steam to heat the tank. When the water reaches the desired set temperature, the PTL pneumatic temperature controller shuts off the air signal to the **PA Air Pilot** and the regulator closes, cutting off steam to the heater.

**Pilot-Operated
REGULATORS**

Model PTL (DIRECT Mounted)

Model PTR (REMOTE Mounted)

Units: inches

Temperature Control with PTRP Temperature Pilot

Pilot-Operated
REGULATORS

Model	PTRP
Pilot Body Material	Cast Steel
Max Inlet Pressure	300 PSIG
Temperature Control Range	20-440° F
Steam Inlet Pressure Range (when Standard Temperature Pilot is used with HD Standard main valve)	15-300 PSIG
Steam Inlet Pressure Range (when Low-Pressure Temperature Pilot is used with HD-LP Low-Pressure main valve)	5-20 PSIG

LOW PRESSURE PTRP-LP Pilot (pressures under 15 PSIG)

Use Code **LP**: Low pressure Temperature Pilot is required for steam pressure under 15 PSI. (Range 5 - 20)

PILOT: Example Model Code: **PTRP-LP-06-08-S15**

LOW PRESSURE HD Main Valve (pressures under 15 PSIG)

Use Code **LP**: A Low Pressure Main Valve must be used in conjunction with a Low Pressure Temperature Pilot for steam pressure under 15 PSIG

MAIN VALVE: Example Model Code: **HD-13-N-LP** (Range 5 - 20)

Typical Applications

The **PTRP-Temperature Pilot** is used with the HD Regulator to control temperature in various processes and systems. The PTRP uses a vapor tension system to actuate the bellows in the temperature pilot giving it a faster reaction time and better temperature sensitivity than the standard PT pilot. They can be used on: oil heaters, ovens, process heaters, vats, dryers, jacketed kettles, and semi-Instantaneous water heaters.

Features

- Stainless steel heat-treated valve and seat for extended service life
- Standard bulb & capillary is copper, which has the best heat transfer properties.
- Standard capillary length is 8 ft. with 316 stainless steel armour-protection

Options

- **Capillary Lengths**: Available in 8, 12, 16, 20 & 24-ft.
- **Special Materials**: Sensing bulb, thermowells, and capillary are available in special corrosion resistant materials.
 - 316 stainless steel capillary, bulb & bushing
 - 316 stainless steel armor with standard capillary
- **Thermowell (Separable Socket)**: Available in stainless steel or copper
- **Temperature Sensing Dial**: Indicates temperature of process being controlled
- **SDWA Compliance (Safe Drinking Water Act)**; Suffix Code SDWA

Specifications

Dial Thermometer:	4" dial, stainless steel case, swivel and angle adjustment (Model PTRP-94 only)
Housing:	Die cast aluminum, epoxy powder coated grey finish
Bellows:	High pressure brass, corrosion resistant, tin plated finish (not shown)
Over-Temperature Protection:	Upper range limit +100° F

MATERIALS for PTRP Pilot

Pilot Body	Cast Steel
Valve and Seat	Heat-treated Stainless Steel
Support Bracket	Aluminum
Bulb & Capillary	Copper (optional stainless steel)
All Other Parts	Brass

MATERIALS for HD Main Valve

Body	Ductile Iron
Cover	Ductile Iron
Gasket	Grafoil/Garlock
Cover Screws	Steel
Pilot Adapter	Cast Steel
Screen	Stainless Steel
Tubing	Copper
Valve Seat	Hardened SST (55 Rc)
Valve Disc	Hardened SST (55 Rc)
Diaphragm	Phosphor Bronze

HD Valve with PTRP-Temperature Pilot Application

A semi-instantaneous steam-to-water heater is a common application where the simple benefits of a self-contained, pilot-operated regulator with temperature sensing pilot may be favored over more complex and expensive control valves. The thermally sensitive bulb of the PTRP pilot contains a fluid that creates a vapor which increases or decreases in pressure as the sensing bulb – sensing the heated water – temperature increases or decreases. This vapor pressure is transmitted hydraulically to the bellows, which actuates the pilot and HD regulator to control the flow of steam into the heater. At start-up, the pilot is manually-adjusted to raise the temperature set point and allow steam to flow through the pilot and valve. As the heated water nears the temperature set point, the vapor pressure in the sensing bulb increases and expands the bellows, closing the pilot and regulator to proportionally limit the steam supply.

Temperature Control

Sensing Bulb Selection & Installation:

The sensing bulb and capillary is available in either Copper (standard) or Stainless Steel (for corrosive applications). Copper has the best heat transfer properties and should always be chosen unless used in corrosive service. Sensing bulb length is dependent upon the capillary length required; longer capillary lengths require a longer bulb to hold the additional actuating fluid. When installing the sensing bulb, the Union Hub is first threaded into a tank or piping system. The bulb slides thru the Union Hub and held in place by threading in the Union Nut. The angled seating surface of the bulb forms a metal-to-metal seal to the Union Hub, preventing the leakage of process fluid.

Sensing Bulb & Capillary						
ORDER CODE	Sensing Bulb Material	Capillary Tubing Material	Capillary Length in Feet			
			8, 12, 16	20	24	"D" Bulb Dia.
S15	Copper (Brass Union Hub)	Copper with Stainless Steel Spiral Armor	A	13"	16"	20"
			U	12.25"	15.25"	19.25"
S16	Stainless Steel (Stainless Steel Union Hub)	Stainless Steel with Stainless Steel Spiral Armor	A	13"	16"	20"
			U	12.25"	15.25"	19.25"
SB15* (special 9")	Copper (Brass Union Hub) (9" bulb)	Copper with Stainless Steel Spiral Armor	A	9"	9"	9"
			U	8.25"	8.25"	8.25"
SB16* (special 9")	Stainless Steel (Stainless Steel Union Hub) (9" bulb)	Stainless Steel with Stainless Steel Spiral Armor	A	9"	9"	9"
			U	8.25"	8.25"	8.25"

***Note for 9" Bulb:**

Care should be taken when using 9" bulbs, and they should only be used in applications where space considerations exist. They should not be used when the temperature of the actuator housing is higher than the sensing bulb temperature, as this condition may create erratic temperature control. The temperature of the actuator housing is affected by the surrounding ambient temperature as well as the steam temperature flowing through the valve and may reach 140°F.

For SDWA Compliance (Safe Drinking Water Act) of bulb and connection, use Suffix Code SDWA.
Example Model Code: **PTRP-91-06-08-SB15-SDWA**

Thermowell Option (ordered separately)

Thermowells isolate and protect the sensing bulb from the process fluid; available in either brass (better heat transfer properties) or Stainless Steel for corrosion resistance. They allow for sensing bulb removal and replacement without having to drain liquid from the system. For corrosive applications, a Stainless Steel thermowell (with a copper sensing bulb) can be used. For best temperature control use a copper sensing bulb with a brass thermowell. Thermowells are also recommended for applications with excessive system pressures or extremely turbulent flow to protect the sensing bulb from damage.

Note: to ensure minimum response time, Heat Transfer Paste should be applied to the sensing bulb before installation into the thermowell.

THERMOWELLS - Model Numbers & Lengths

Brass Model No.	Stainless Steel Model No.	Nominal Length	"A" INSERTION LENGTH (in.)		Capillary Length in Feet
			BULB	THERMOWELL	
536-S2	536-S6	13"	12.25	13.00	8, 12 or 16
536-SE2	536-SE6	16"	15.25	16.00	20
536-WE2	536-WE6	20"	19.25	20.00	24
535-M2*	535-M6*	9"	8.25	9.00	8, 12 or 16

- Notes:
- 1) Other connections and lengths may be available, consult factory.
 - 2) External pressure rating on Brass is 500 PSI max.
 - 3) External pressure rating on 316 SS is 1000 PSI max.

HD Main Valve with PTRP-Temperature Pilot

Model Code for Main Valve: **HD-17-F150** (2" HD Series Valve with 150# Flanged)

Model Code for Pilot: **PTRP-94-06-08-S15**
(Temperature Pilot with Indicating Dial (105-195°F) with 8 Ft. Capillary, Copper Bulb)

How to write proper model number:

Explanation of Model Number:	PTRP-91	06	08	S15
	Model	Temp. Range	Cap. Length	Bulb Type
Model Number:	PTRP-91-06-08-S15			

Model PTRP-94 contains Temperature Indicating Dial
Model PTRP-91 is Non-Indicating

Example Model Codes:

- 1) **PTRP-91-06-08-S15** (105°F - 195°F Temp Range, 8 ft. Capillary, 12" Copper Bulb)
- 2) **PTRP-94-06-08-S15** (105°F - 195°F Temp Range, with Dial Thermometer, 8 ft. Capillary, 12" Copper Bulb)

Trip-Stop

Trip-Stop Pilot	TSP
Body Material	Cast Steel
Max Inlet Pressure	300 PSIG
Inlet Pressure Range (with HD Standard main valve)	15-300 PSIG
(with HD-LP Low-Pressure main valve)	5-20 PSIG
Minimum Differential Pressure (with HD Standard main valve)	10 PSI
(with HD-LP Low-Pressure main valve)*	3 PSI

*Note: A Low Differential Pressure (LDP) HD Main Valve is typically selected to minimize pressure drop across the valve. Consult factory for assistance, if needed.

Typical Applications

The **Trip-Stop Pilot** is designed to prevent over-pressurization of downstream piping in steam systems where application codes allow its use in lieu of a safety valve (SRV). The pilot is installed on a separate HD Series main valve that is installed downstream of the main pressure reducing valve. If the downstream control pressure increases above the factory-set pressure on the Trip-Stop pilot, the pilot trips to release the diaphragm pressure and close the main valve to stop the steam flow. Once the pressure downstream is below the set point, the pilot may be manually reset.

Features

- The TSP-Trip Stop Pressure Pilot is used to protect downstream steam pressure from over pressurizing
- Pilot is installed using 1/4" NPT Connection
- Solid floating diaphragm
- Watson McDaniel's pilots can be used with other manufacturers' regulators

MATERIALS for TRIP-STOP Pressure Pilot

Pilot Body & Cover	Cast Steel
Seat Gasket	302 SS
Diaphragm	Phosphor Bronze
Head & Seat Assembly	Hardened SST (55 Rc)

OPERATING PRESSURES

Inlet Pressure Range:

15-300 PSIG (Standard Main Valve)
5-20 PSIG (Low Pressure Main Valve)

Minimum Differential Pressure:

10 PSI (Standard Main Valve)
3 PSI (Low Pressure Main Valve)

* **XXX** = Set Pressure

Pressure Range PSI	Model Code	Spring Color	Weight lbs
3-25	TSP-Y-XXX*	Yellow	16
20-100	TSP-B-XXX*	Blue	16
80-200	TSP-R-XXX*	Red	16

How to Size / Order

TSP - TRIP STOP PILOT

Specify: • Trip Set Pressure (factory set)

Example: **TSP-B-040**: TSP Pilot with 40 PSIG set pressure

REGULATOR BODY

Specify: • **HD** regulator body
• Regulator size or capacity
• End connections (threaded, 150/300# flanged)

Differential Pressure

Differential Pressure Pilot	PDP
Body Material	Cast Steel
Max Inlet Pressure	300 PSIG
Reduced Outlet Pressure Range	3-200 PSIG
Inlet Pressure Range	
(with HD Standard main valve)	15-300 PSIG
(with HD-LP Low-Pressure main valve)	5-20 PSIG
Minimum Differential Pressure	
(with HD Standard main valve)	10 PSI
(with HD-LP Low-Pressure main valve)	3 PSI

Typical Applications

The **PDP-Differential Pressure Pilot** is used with the **HD Regulator** to maintain steam pressure at a set differential pressure above another media source. This is typical on an oil burner where steam used for atomization is injected into the oil burner at a set pressure above the incoming oil supply pressure. When oil pressure fluctuates (based on demand), the steam pressure will maintain a constant differential pressure above the oil pressure.

Features

- The PDP-Differential Pressure Pilot is used to maintain downstream steam pressure to a set differential pressure above loading pressure
- Accuracy to within ± 2 PSI
- 3 overlapping spring ranges to choose from
- Pilot is installed using only four bolts
- Full port strainer and blowdown valve on pilot adapter for ultimate protection from dirt and scale
- Solid floating diaphragm
- Watson McDaniel's pilots can be used with other manufacturers' regulators

Options

- Solenoid pilot can be added for remote on/off control of regulator

MATERIALS for PDP Differential Pressure Pilot

Pilot Body	Cast Steel
Seat Gasket	302 SS
Diaphragm	Phosphor Bronze
Head & Seat Assembly	Hardened SST (55 Rc)

OPERATING PRESSURES

Inlet Pressure Range:

15-300 PSIG (Standard Main Valve)

5-20 PSIG (Low Pressure Main Valve)

Ambient Temperature	14 to 140°F
Actuator Weight	12.4 lbs

Typical Applications

The **Electric Pilot** is used with HD regulators for a variety of applications including On/Off Control. The control signal range is 4-20mA or 0-10V. A Low-Pressure version (-LP) is available for 5-20 psig steam supply pressures.

Features

- Fail-Safe Mode: An integrated power spring is used to drive the valve fully closed or open in the event of power loss to the actuator.
- Integral Positioner: Accepts 4-20mA or 0-10 VDC control signals, eliminating the need for a separate I/P transducer.

10-40 PSIG	yellow
25-100 PSIG	blue
75-300 PSIG	red

Typical Applications

The **HSP & HSP-SS Series Main Valve with integral Pressure Pilot** reduces steam pressure in steam system piping mains and process applications. This pilot-operated regulator is specifically used in applications where the properties and benefits of Cast Steel or Stainless Steel are desired and/or specified. Using steel as the material of construction for the main valve body extends the pressure-temperature rating of the regulator. A unique two-bolt pilot adapter design and field-reversible tubing offer even greater versatility to this type of regulator, further reducing maintenance downtime. These valves share the same design and proven reliability of the Watson McDaniel HD-Series Regulators, providing extremely accurate control of downstream system pressure even when inlet pressure to the regulator fluctuates or steam usage varies.

Features

- Cast Steel body for higher pressure and temperature ratings
- Stainless Steel body for improved corrosion resistance
- New, convenient bolt-on pilot design simplifies installation
- New diaphragm design improves performance and extends life
- Hardened stainless steel trim for extended life
- Full port strainer and blowdown valve on pilot adapter for ultimate protection from dirt and scale
- Maintains downstream pressure to ± 1.0 PSIG
- Choice of three overlapping spring ranges
- Pre-mounted pilot & tubing simplifies installation

Inlet

Pilot shown
Left-mounted
(opposite-mounted)

HSP and HSP-SS available with other pilots (i.e. temperature, back pressure, etc.); Consult factory.

Pilot Mounting

Standard pilot mounting is on the right side of the regulator when looking into the outlet port. For opposite-mounting, specify when ordering. Pilot mounting on HSP & HSP-SS regulators are field-reversible.

Pressure Pilot

The spring-adjusted Pilot is used for general purpose pressure reducing applications.

Pressure Reducing Station for Steam Application

Noise Reduction

Noise Attenuation Equipment is used to reduce unwanted or excessive noise that commonly occurs in pressure reducing stations.

Noise Reduction Capability: 5–10 dBA

Pilot-Operated
REGULATORS

Series-OP
Orifice Plate

Description

Selection: **Series-OP** orifice plates are custom engineered to maximize noise attenuation and reduce dbA to the lowest achievable value. The number and diameter of holes will be determined based on application conditions, and the plate diameter will typically be equal to the recommended downstream pipe size. Therefore, the following information is required for selection:

- Inlet (Supply) Pressure to the HD/HSP Regulator*
- Outlet (Downstream) Pressure of the HD/HSP Regulator*
- Steam Flow Rate (lb/hr)

How it Works

The **Series-OP** Orifice Plate with its drilled orifice pattern is installed after the pressure regulating valve to smooth out turbulence caused by the pressure drop across the regulator. Noise reduction levels of **5–10 dBA** can typically be achieved; higher possible.

Installation

The **Series-OP** Orifice Plate is installed between ANSI flanges immediately after the regulator.

REGULATORS

Acoustic Silencer for Pressure Regulating Valves

Noise Attenuation Equipment is used to reduce unwanted or excessive noise that commonly occurs in pressure reducing stations.

How it Works

The **Series-H** Acoustic Silencer incorporates a **Dual Diffuser** tube design. The inner tube has a drilled orifice pattern and the outer tube contains an integral layer of sound absorbing insulation. Noise reduction levels of **20-30 dBA** can typically be achieved.

Installation

The **Series-H** Diffuser Tube should be installed immediately downstream of the regulator, as shown below.

Noise Reduction Capability: 20-30 dBA

Series-H
Acoustic Silencer

Series INSUL

Insulation/Acoustic Jackets for HD Regulator

Noise Reduction Capability: 0-5 dBA

The **Series INSUL** Thermal Insulation Jacket is designed to fit and be used on the HD, HSP, & HSP-SS Series Pilot-Operated Regulating Valve. This jacket provides insulation to minimize heat energy losses. The jacket thickness and materials of construction can also help to reduce noise when installed on the HD, HSP, & HSP-SS Series Regulators.

Stainless Steel

Watson McDaniel's DL Series Dome-Loaded Regulators were designed as a direct replacement for Leslie's GP-Series Dome-Loaded Regulators.

OPERATING PRESSURES

Inlet Pressure Range:

15*-300 PSIG (DLDI)

15*-450 PSIG (DLCS & DLSS)

*Note: Minimum Inlet Pressure 5 PSIG with Teflon diaphragm.

Minimum Differential Pressure: **3 PSIG**

Typical Applications

The **DL Series Dome-Loaded** regulator uses Air Pressure to directly load the diaphragm to control downstream steam pressure. These valve are used for general steam distribution, as well as specific applications such as rubber molding lines and other steam process applications. An external sensing line connected between the valve diaphragm area and the outlet piping provides the feedback necessary for accurate pressure control. Downstream steam pressure is then easily controlled by adjusting the air pressure to the diaphragm. Use Air-Loading Chart to determine air pressure required to control desired steam pressure. These valves share the design and proven reliability of the Watson McDaniel HD Series Regulators. The specially designed diaphragms allow for 100:1 flow rangeability.

Features

- Ductile Iron body for higher pressures than cast iron
- Cast Steel body for higher pressure and temperature ratings
- Stainless Steel body for improved corrosion resistance
- New diaphragm design improves performance and extends life
- Hardened stainless steel trim for extended life
- 100:1 Flow Rangeability
- Maintains downstream pressure to ± 1.0 PSIG
- Can be used for other modes of control including temperature control and back pressure.
(Consult factory for additional information.)
- Optional soft disc trim for increased shut-off tightness in low-pressure steam applications

DOME-LOADED REGULATORS

Description of Operation

The **DL Series Regulator** is being used in conjunction with the **PL2 Control Panel Board** to regulate steam pressure. A small air regulator on the panel board can be adjusted to control the air pressure to the valve diaphragm chamber. One gauge on the panel board measures air line pressure to the panel board and the other gauge shows the air pressure being sent to the valve. Steam pressure at the outlet of the regulator is controlled by the air pressure signal to the valve. The Air Loading graph in this section can be used to determine the air loading pressure required to maintain the desired steam outlet pressure.

REMOTE CONTROL PANEL BOARDS

Three different options of remote control panel boards can be used along with the DL Series Regulator. Supply air is fed directly through the control panel board to the Regulator. You can choose one of the three options of control panel boards when using the Dome-loaded regulators. Minimum of 5 PSIG air supply pressure is required.

PL1

PL2

PL3

PL1

The **PL1** is made up of an air pressure regulator with adjustment knob and pressure gauge that measures the amount of air pressure going to the valve (air signal). Steam pressure of the system is controlled by adjusting the air pressure regulator.

PL2

The **PL2** is the same as the PL1 with the addition of an extra air pressure gauge for measuring the air supply pressure to the control panel board.

PL3

The **PL3** is the same as the PL2 with the addition of a Steam Pressure Gauge for measuring steam pressure on the outlet side of the regulating valve.

Notes: 1) Capacities based on 95% accuracy (2 psi minimum droop).
 2) For inlet pressures greater than 300 PSIG, use DLCS or DLSS regulators only.
 3) For expanded capacities, refer to chart in HD Series section.

DOME-LOADED
REGULATORS

How To Use Air Loading Chart

Example using 2" DL Series:

- Steam Inlet Pressure (P1) = 175 psig
- Steam Reduced Pressure (P2) = 25 psig

Use the air loading chart to determine the Air Signal required above the Steam Outlet Set Pressure. Then, add the additional air signal to the Steam Outlet Pressure to determine the Total Air Pressure required.

Find **150 psi** ΔP on bottom of chart (i.e. 175 psig - 25 psig = 150 psi) and read up vertically to **2" diagonal line**. Then read horizontally left for the additional air signal required.

Then Add additional Air Signal to P2.
P2 = 25 psig
 (additional air signal) = **23 psig**

Total Air Pressure Required to Control Downstream Steam Pressure to 25 psig

Air Signal = 25 + 23 = 48 psig

Note: Consult factory for Teflon diaphragms and 2 1/2" & 4" DL Series Air-Loading Requirements.

Direct-Operated Pressure & Temperature Regulating Valves

Direct-Operated Regulators are used for controlling pressure or temperature in a variety of applications.

Pressure Regulating Valves

Page No.

O-Series - Cast Iron • 3/8" - 2"

268-271

Steam • Water • Oil • Air • other Liquids & Gases

The O-Series, with Cast Iron body and Hardened Stainless internals, is our most popular and economical solution for reducing pressure in STEAM systems. It is also suitable for Water, Oil, Air as well as other Liquids & Gases. Soft Seat options available for tight shut-off.

OSS-Series - Stainless Steel • 1/2" - 1 1/4"

272-273

Steam • Water • Oil • Air • other Liquids & Gases

The OSS-Series is the Stainless Steel CF8M version of our popular and versatile O-Series and can be configured for Steam, Water, Oil, Air as well as other Liquids & Gases. Hardened Stainless Steel Internals are standard; Soft-Seating options are available for tight shut-off are available.

B-Series • 1/2" - 4"

274-275

Water • Air • Oil • other Liquids & Gases

The B-Series is primarily used for reducing pressure in WATER systems. It is also suitable for Air, Oil, as well as other Liquids and Gases. The B-Series offers higher capacity than the O-Series.

455-Series • 1/2" - 4"

276-277

Steam • Air • Other Gases

The 455 is ideally suited for reducing pressure in STEAM applications and requires only 5 PSIG minimum inlet pressure. Excellent for use in steam systems that contain large amounts of scale that may cause failure in pilot-operated regulators.

403-Series • 1/2" - 4"

278-281

Steam • Air

The 403 are pilot-operated, piston-actuated, pressure regulators primarily used for reducing pressure in STEAM systems. This regulator is available with an optional internal sensing line which simplifies installation.

Direct-Operated Pressure & Temperature Regulating Valves

Relief & Back-Pressure Valves

Page No.

R-Series & 10691-Series - Bronze • 1/2" - 3"

282-284

Relief & Back Pressure Valves: Water, Liquids, Air

The R-Series & 10691 Series are economically-priced Back Pressure Relief Valves for Liquid service. Relief Valves (Back Pressure Valves) are used to maintain a specific back pressure or to protect systems from an over-pressure condition. 10691-Series is similar to the R-Series with the exception of a soft-elastomeric seat for bubble-tight shut-off.

3040-Series - Bronze/Stainless Steel • 1/2" - 2"

285-287

Relief & Back Pressure Valves: Water, Liquids, Air

The 3040 Back Pressure Relief Valve offers a much higher capacity than the R-Series. Used for Liquid service. Relief Valves protect systems from over-pressurized conditions.

Pressure & Temp
REGULATORS

Temperature Regulating Valves

W91 & W94 Series

289-312

Self-Operating Temperature Regulating Valves:

Heating, Cooling, Mixing & Diverting

The W91/W94 Series Temperature Regulating Valves are used for controlling process temperature in industrial and HVAC applications.

Typical applications are: Heating different processes & devices with steam, Cooling equipment with chilled water, or Mixing & Diverting hot & cold liquids using 3-Way Valves.

What are Pressure Regulating Valves (PRVs) used for?

Steam, liquids and other gases are typically transported through piping systems at relatively higher pressure than ultimately needed and therefore need to be reduced to a lower pressure at the final point of use. The purpose of the Pressure Regulating Valve (PRV) is to reduce the pressure of steam, liquid or gas to a lower pressure appropriate for its final application. All pressure regulating valves are self-operated, which means they do not require any outside source of power such as air pressure or electric actuators to operate. In contrast, Control valves do require an outside source of power to actuate the valve. All pressure regulating valves are Self-Operated; however, they are categorized as either **Direct-Operated** or **Pilot-Operated**. The Pilot-Operated Regulators are either **Piston-Actuated** or **Diaphragm-Actuated**.

Direct-Operated

O-Series for Steam, Air & Water
OSS-Series for Steam, Water, Oil & Air
455-Series for Steam
B-Series for Water & Liquids.

O-Series

OSS-Series

B-Series

455-Series

Direct-operated pressure regulating valves are the simplest in design and the most economical to purchase and therefore should be used whenever suitable. The downstream pressure of the steam or liquid being regulated is used to position the diaphragm and valve disc to control the amount of flow through the valve. Downstream pressure adjustment is easily made by turning the adjustment screw to increase or decrease compression on the control spring. The limitation of the direct-operated type regulator is a variation of up to 10% of initial set pressure depending on changes in flow through the valve. As flow requirements through the valve increase, the outlet set pressure will tend to decrease.

For example; Inlet pressure is 100 PSIG and downstream pressure is adjusted to maintain 50 PSIG while 250 lbs/hr of steam flows through the valve. If the steam flow rate happens to increase to 500 lbs/hr, then the outlet pressure would drop to 45 PSIG.

Direct-operated regulators are suitable for many less critical uses in the low-to-moderate flow range including small heaters, humidifiers, hospital equipment, tire molds, typical applications in food processing, as well as many other general uses.

Introduction

Pilot-Operated **Piston-Actuated**

403-Series for Steam, Air & Gas Applications

Pilot-operated piston-actuated pressure regulating valves contain a separate pilot valve which is mounted on top of the main valve. The valve senses the downstream pressure (low pressure side) and precisely modulates a small amount of steam from the upstream side (high pressure side) to the top of the piston chamber, which in turn controls the opening of the main valve. When steam demand increases and downstream pressure starts to drop, the valve is opened further, allowing for additional flow. Pilot-operated piston-actuated regulators have increased accuracy and consistency of set pressure when compared to the Direct-operated type. Set pressure is more stable and will only vary a few percent over the full flow range. Downstream pressure sensing is either done internally (internally sensed) or by using an external pressure sensing line (externally sensed).

The piston-actuated valves are more compact than diaphragm-actuated valves; however, since the piston has more friction than a freely flexing diaphragm, they are not quite as accurate. These valves can be used for low-to-high flow applications or when larger flow rates or more accurate pressure control is required than can be achieved with direct-operated pressure regulators.

External Sensing (standard)
(requires sensing line)

Internal Sensing Option
(Specially drilled internal sensing path eliminates the need for an external sensing line)

PRESSURE
Regulators

Pilot-Operated **Diaphragm-Actuated**

Pilot-Operated Diaphragm-Actuated PRVs contain a separate pilot valve mounted externally to the main valve. The pilot valve senses the downstream pressure (low pressure side) through an external sensing line which in turn controls the opening of the main valve. The sensitivity and frictionless motion of the diaphragm, in combination with using a control pilot, make this style of regulators the most accurate. Downstream pressure can often be controlled within 1-2 % of initial set-pressure. Refer to Watson HD-Series Regulators for steam applications.

NPT 250 PSIG @ 450°F

PRESSURE
Regulators

Typical Applications

The **O-Series** direct-operated pressure regulators with heavy duty cast iron bodies are suitable for a wide range of applications in the low-to-moderate flow range. Applications include small heaters, humidifiers, various hospital equipment, tire molds, as well as many other general uses. This style of regulator does not require an external sensing line. Set pressure is controlled by turning an adjustment screw with lock nut that increases or decreases spring force above the diaphragm. Several spring ranges are available, depending upon the downstream pressure that needs to be maintained. O-Series contains hardened stainless steel seat and disc for extended service life. Phosphor Bronze Diaphragm specifically designed for Steam service is considered a preferred choice over Stainless Steel diaphragms which are prone to work-hardening and potential cracking. Viton diaphragms are specifically designed for water, air, gases and other liquid service and have a working temperature range up to 300°F.

Features & Options

- Hardened stainless steel seat and disc for extended service life (55 Rc)
- Optional Teflon disc for increased shut-off tightness
- Phosphor Bronze diaphragm for Steam Service
- Viton diaphragm for up to 300°F for Water, Oil & Air Service
- Double spring option available for extended outlet pressure range
- Integral stainless steel strainer on 3/4" HC, 1", 1 1/4", 1 1/2" & 2"

How to Size/Order

From the Capacity chart, find the inlet pressure and required regulator outlet pressure. Follow across chart to nearest capacity (steam, air, water) that meets or slightly exceeds demand requirements. Follow vertically up to determine appropriate size. When exact application values are not shown, interpolate between values. Select a model with the spring range that accommodates the required outlet set pressure.

Example:

Application: 200 lbs/hr of 100 PSIG Steam reduced to 30 PSIG
Model Code: **O-12-N-14-B** (1/2" O-Series, 10-50 PSIG spring range, NPT with Bronze Diaphragm for Steam)

* Air and water capacities are based on using elastomeric diaphragms.

** 3/4" HC is high-capacity version of standard 3/4" valve.

Notes: For capacities of other gases multiply the air capacities by the following factors: Argon-0.85 CO₂-0.81 Helium-2.69 Nitrogen-1.02
For capacities of other liquids multiply the water capacities by the following: Diesel Fuel (68F) - 1.07 Kerosene (68F) - 1.11 Ethylene Glycol (68F) - 0.56

Regulators

Pressure Regulating Valve

O-Series
Direct-Operated

Pressure Regulating Valves for

Steam: Phosphor Bronze Diaphragm

Water, Oil, Air: Viton Diaphragm

The **O-Series** with Cast Iron body and Hardened Stainless internals, is our most popular and economical solution for reducing pressure in STEAM systems. It is also suitable for Air, Water, Oil as well as other Liquids and Gases. When used on STEAM Applications, the valve must be specified with a Phosphor Bronze Diaphragm (Suffix Code **B**). When used on Air, Water & Oil or other Liquid Applications, the valve must be specified with a Viton Diaphragm (Suffix Code **V**).

Important Application Note:

- Use Phosphor Bronze Diaphragms for Steam.
- Use Viton diaphragms for Water, Air and Oil Applications.

Phosphor Bronze Diaphragms may fracture if used on Liquid Service. Use for Steam Only.

Diaphragm Code:

B - Phosphor Bronze for Steam Service

V - Viton (300 °F Max) for Air & Other Liquids

Teflon Soft-Seat Option Suffix Code: 6T

Example Model Codes:

- 1) **O-13-N-14-B**
(O-Series, 3/4" NPT, 10-50 PSI, Single Spring, **Phosphor Bronze Diaphragm**)
- 2) **O-13-N-14-V**
(O-Series, 3/4" NPT, 10-50 PSI, Single Spring, **Viton Diaphragm**)

Pressure Regulating Valve

OSS-Series
Direct-Operated

Model	OSS-Series
Service	Steam, Air, Water & Other Liquids
Sizes	1/2", 3/4", 1", 1 1/4" *
Connections	NPT, SW, 150# & 300# FLG
Body Material	Stainless Steel CF8M
Seat & Disc	Hardened 420 Stainless Steel (Disc Options - Teflon)
Diaphragm (for Steam)	Stainless Steel - Steam
Diaphragm (for Liquid or Air)	Viton- Water, Air & oil (300°F max)
Max Inlet Pressure	300 PSIG
Min Inlet Pressure	15 PSIG
Max Differential Pressure	125 PSI
Min Differential Pressure	15 PSI

*1 1/2" End Connections available; consult factory.

Design Pressure/Temperature Rating – PMA/TMA

NPT:	300 PSIG @ 450° F
150# FLG	195 PSIG @ 400° F
300# FLG	300 PSIG @ 450° F

Typical Applications

The **OSS-Series** direct-operated pressure regulators with heavy duty stainless steel bodies are suitable for a wide range of applications in the low-to-moderate flow range. Applications include small heaters, humidifiers, various hospital equipment, tire molds, as well as many other general uses. The Stainless Steel Body & Trim also make this valve a consideration for potable water service.

This style of regulator does not require an external sensing line. Set pressure is controlled by turning an adjustment screw with lock nut that increases or decreases spring force above the diaphragm. Several spring ranges are available, depending upon the downstream pressure that needs to be maintained. OSS-Series contains hardened stainless steel seat and disc for extended service life (soft seat options available). Stainless Steel Diaphragms are offered for steam service. Viton diaphragms are specifically designed for water, air, gases and other liquid service and have a working temperature range up to 300°F.

Features & Options

- Hardened stainless steel seat and disc for extended service life (55 Rc)
- Optional Teflon Disc Seats for increased shut-off tightness
- Stainless Steel diaphragm for Steam Service
- Viton diaphragm for up to 300°F for Water, Oil & Air Service
- Integral stainless steel strainer on 1" and 1 1/4" only

250# FLG	250 PSIG	@ 450°F

Typical Applications

The **B-Series** direct-operated pressure regulators with balanced valve trim are used for reducing pressure in air and water systems. These regulators are commonly found in industrial plants, apartment buildings, water supply systems, schools and underground water distribution systems. The soft-seated elastomeric Viton disc has an operating temperature up to 300°F and will produce a Class V shutoff. No external sensing line is required with this style of regulator.

Features & Options

- Diaphragm, disc and cup packing in Viton for 300°F service
- Balanced pressure regulator allows accurate control even when incoming pressure fluctuates
- Valve has a Class V shut-off rating due to the "soft-seated" Viton disc

How to Size/Order

From the Capacity chart, find the inlet pressure and required regulator outlet pressure. Follow across chart to nearest capacity (water, air) that meets or slightly exceeds demand requirements. Follow vertically up to determine appropriate size. When exact application values are not shown, interpolate between values. From the spring range chart, select the spring range that accommodates the required outlet set pressure.

Example:

Application: 35 GPM of 70 PSIG Water reduced to 20 PSIG
Model Code: **B-14-N-3-V** (B-Series, 1" NPT, 5-35 PSIG spring range)

X=Spring Code (reference Spring Selection Table).

Typical Applications

The **455 Series** direct-operated pressure regulating valves are used for pressure reduction applications on steam, air and other gases. Balanced seat and disc design allows these valves to be used in applications with low inlet pressure; down to 5 PSIG. Unlike pilot-operated valves, the 455 does not contain any small pilot orifices and are therefore less susceptible to issues caused by dirt and pipe scale. The 455-Series is installed using an external sensing line which is connected several feet downstream of the valve. Placing the pressure sensing line out of range of valve discharge turbulence improves accuracy of downstream pressure.

Features

- Operates with minimum inlet pressure of 5 PSIG
- Stainless steel internals
- Excellent for use in steam systems that contain excessive amounts of pipe scale and other contaminants
- Pressure balanced valve & seat for more precise control of downstream pressure

Options & Notes:

Must Specify Spring Code when Ordering:

Use the 455 Spring Selection Table to specify the proper spring(s) based on valve size and reduced pressure range by Replacing the "X" with Spring Code from chart.

Example Model Codes:

- 1) **455-15-N-65**
(455 Series, 1 1/4" NPT, 1-6 PSIG outlet pressure)
- 2) **455-18-F125-73**

*Note: 2" 455 flanges are 150# or 300#.

How to Size/Order

From the Capacity chart, find the inlet pressure and required regulator outlet pressure. Follow across chart to nearest capacity (steam) that meets or slightly exceeds demand requirements. Follow vertically up to determine appropriate size. When exact application values are not shown, interpolate between values. From the spring range chart, select the spring range that accommodates the required outlet set pressure.

Example:

Application: 1000 lbs/hr of 20 PSIG Steam reduced to 5 PSIG
Model Code: **455-16-N-65** (455-Series, 1 1/2" NPT, 1-6 PSIG spring range)

CAPACITIES — Steam (lbs/hr); Water (GPM)

Note: Air in SCFM (Standard Cubic Feet per Minute) = Steam (lbs/hr) x 0.36

Model	403 Series
Service	Steam & Air
Sizes	1/2" – 4"
Connections	NPT, 150# FLG, 300# FLG
Body Material	Ductile Iron
Seat & Disc	Hardened 420 Stainless Steel (55 Rc)
Max Inlet Pressure	450 PSIG
Min Inlet Pressure	20 PSIG
Max Differential Pressure	250 PSI
Min Differential Pressure	15% of Inlet Pressure (10 PSI min)

Design Pressure/Temperature Rating – PMA/TMA

NPT	450 PSIG @ 650°F
150# FLG	150 PSIG @ 566°F
300# FLG	450 PSIG @ 650°F

PRESSURE
Regulators

Typical Applications

The **403 Series** pilot-operated (piston-actuated) pressure regulating valves are used for pressure reduction on steam mains and other process equipment. Pilot-operated regulators will maintain a constant and accurate downstream pressure regardless of fluctuations in supply pressure or usage. These regulators can be supplied with an optional internal sensing line which simplifies installation. Piston-actuated regulators are more compact than Diaphragm-actuated regulators. The 403 Series contains all stainless steel internals for high-pressure applications up to 450 PSIG. The Double-Spring option is available for a wider range of reduced pressures.

Features & Options

- Pilot-operated regulators minimize outlet pressure fluctuations even when load varies
- Internal Sensing option (If requested, the regulator can be modified to internally sense pressure, eliminating the need for an external sensing line)
- Ductile Iron body to handle increased pressure and temperature
- Hardened stainless steel seat and disc (55 Rc)

Pressure Reducing Station with External Sensing Line

External Sensing (standard)
(requires sensing line)

Pressure Reducing Station with Internal Sensing Line

Internal Sensing Option
(Specially drilled internal sensing path eliminates the need for an external sensing line)

How to Size/Order

From the Capacity chart, find the inlet pressure and required regulator outlet pressure. Follow across chart to nearest capacity (steam, air) that meets or slightly exceeds demand requirements. Follow vertically up to determine appropriate size. When exact application values are not shown, interpolate between values. From the spring range chart, select the spring range that accommodates the required outlet set pressure. Specify Internal or External (remote) Pressure sensing.

Example:

Application: 12,500 lbs/hr of 300 PSIG Steam reduced to 125 PSIG
Model Code: **403-17-N-0010-R** (2" 403 Series Valve, 100-200 PSIG spring range, with external sensing)

Note: Flange selection may reduce pressure/temperature ratings.

X = Spring Code (reference Spring Selection Table).

403 Spring Selection Table

Reduced Outlet Pressure PSI	Spring #	Code = X	Color
SINGLE Spring Ranges			
0 to 10	#13	0013	Blue & yellow
10 to 50	#14	0014	Black & yellow
40 to 100	#9	0009	Red & yellow
100 to 200	#10	0010	Green & blue
DOUBLE Spring Ranges			
30 to 125	#14 & #9	1409	Red & yellow Black & yellow
50 to 200	#9 & #10	0910	Red & yellow Green & blue

Note: For 200 - 280 PSI use Bellville washers (Code = **0015**)

Notes:

Must Specify Spring Code when Ordering:

Use the 403 Spring Selection Table to specify the proper spring(s) based on reduced pressure range by replacing the "X" with Spring Code from chart.

Internal Sensing (not available with 0-10 PSI range)

Pressure Sensing Codes:

Code R - Remote Pressure Sensing
Code I - Internal Pressure Sensing

Example Model Code:

1) **403-15-N-0014-R**
(403 Series, 1 1/4" NPT, 10-50 PSI, Remote Pressure Sensing)

PRESSURE
Regulators

Description

The **R-Series** & the **10691-Series** Back Pressure & Relief Valves relieve upstream pressure in a variety of processes. **R-Series** has a stainless steel disc and the **10691-Series** has a soft elastomeric disc for tight shut-off. These valves automatically maintain desired maximum pressure in a vessel or system by relieving excess pressure into lower pressure return line or to atmosphere. Ideally suited for use as pump bypass control valve by maintaining constant pump discharge pressures. Used as a continuously operating valve or for protection against intermittent overpressure conditions.

NOT TO BE USED ON STEAM.

Typical Applications

The **R-Series** & **10691 Series** Back Pressure Relief Valves are used in the following applications:

- Water pump bypass for irrigation, sprinkler systems on golf courses, fountains and fire protection systems
- Fuel oil pump bypass on commercial systems or large residential systems

Note: Not to be used as a safety relief valve on steam systems.

Features & Options

- Four Springs – easily interchanged to cover pressures from 1 to 300 PSIG
- Heavy-duty bronze valve body
- 10691 Series has EPDM Seat for tight shut-off (1/2" - 1") Viton or Teflon options available

Model 10691 has a Soft Disc which allows for Class VI bubble tight shut-off

Pressure Adjustments

To adjust set pressure of valve, remove top cap, loosen lock nut and adjust pressure by rotating adjustment screw. Rotating the screw clockwise increases the compression on the spring thereby increasing the set pressure. Rotating the screw counter-clockwise lowers the set pressure. Tighten the lock nut and replace top cap and gasket.

Not available on 2" & 3" models.

How it Works

The Relief Valve is actuated by the system pressure on the inlet side of the valve. Valve loading is provided by a spring. The adjustment is done by removing the cap and rotating the screw clockwise or counter-clockwise. Spring load balances against the opening force of the upstream (or relief) pressure. Valve will open at the slightest increase in pressure above the spring set point, and will close when the excess pressure has been relieved. The higher the system pressure is above the relief set point pressure, the more flow the valve will pass. It is therefore typical to specify the maximum capacity of a back pressure relief valve at 10% and 20% over set pressure.

A Relief Valve allows water to recirculate through the pump even when the discharge valve on the pump is completely closed. As a rule, a minimum of 20% of the pump capacity must recirculate to prevent overheating of the pumped liquid.

The Relief Valve remains closed until the **Set-Pressure** is reached. When the Set-Pressure is met or exceeded, the spring will compress, allowing the valve to open and flow to occur. It is standard practice to publish flow values at 10% and 20% over the **Set-Pressure**.

Example: A 1" valve set at 50 PSIG will pass 3.1 GPM if the system pressure exceeds the set point by 20%.

Regulators

Relief & Back Pressure Regulating Valve

3040 Series

Water, Air, Oil & Other Liquids

Size	Face-to-Face			B	C
	A NPT Threaded	A 150# Flanged	A 300# Flanged		
1/2"	4 1/8			2 5/16	9
3/4"	4 1/8			2 5/16	9
1"	4 1/8			2 5/16	9
1 1/4"	4 13/16			3 1/4	12 3/4
1 1/2"	5 3/16			3 1/2	13 1/4
2"	6 5/8	10	10 1/2	3 3/8	12

How it Works

The **3040 Series** Back Pressure Valve senses upstream pressure acting on the underside of the diaphragm through a port in the bottom diaphragm case. An increase in the upstream pressure above the set point will compress the spring and allow the valve to open. The spring will close the valve as the upstream pressure decreases to the set-point.

The higher the system pressurizes above the relief set-point pressure, the more flow the valve will pass. It is therefore typical to specify the maximum capacity of a back pressure relief valve at 10% & 20% over set-pressure.

A Relief Valve allows water to recirculate through the pump even when the discharge valve on the pump is completely closed. As a rule, a minimum of 20% of the pump capacity must recirculate to prevent overheating of the pumped liquid.

Protection Against Over-Pressure Condition

Bypass flow occurs when the discharge pressure exceeds the relief valve set point pressure

Notes

Direct-Operated Regulators

Temperature Regulators

TEMPERATURE
Regulators

W91 • Non-Indicating

W94 • Indicating - Dial Thermometer

For **Heating** with Steam
for **Cooling** with Water
Mixing/Diverting for Liquids

Description & Selection

The **W91/W94** Self-Operating Temperature Regulator is a mechanically operated device designed to regulate system temperature by modulating the flow of a heating or cooling fluid in response to temperature changes; requires no external power source. They are recommended for controlling temperature on relatively stable systems, where small valve stroke modulations will correct temperature drift. Where sudden or large load changes, or rapid temperature changes occur, a pneumatically-actuated Control Valve should be considered. Please consult the Control Valve Section of this catalog.

Principle of Operation

The **W91/W94** Temperature Regulator is a fully self-contained unit requiring no external power source (i.e., compressed air or electricity). Regulation takes place when the sensing element (bulb) of the thermal system is exposed to changes in temperature. The thermal system is charged with a predetermined amount of vapor fill, which, when heated, will cause the bellows within the unit's actuator housing to expand.

The valve action is either **In-To-Close for Heating** or **In-To-Open for Cooling**.

HEATING

Normally Open
(in-to-close)

Normally Open Valves are used for **HEATING**, so the valve stem closes (**in-to-close**) as the control signal (temperature) increases.

Single-Seated Balanced Valves are used for Heating Applications (normally steam) where tighter shut-off is required. Leakage rate is approximately 0.01% of the maximum capacity (Class IV shut-off).

COOLING

Normally Closed
(in-to-open)

Normally Closed Valves are used for **COOLING**, so the valve stem opens (**in-to-open**) as the control signal (temperature) increases.

Double-Seated Balanced Valves (standard as shown) are used for Cooling Applications where larger flow rates of water are frequently required, and a small leakage rate through the valve is normally acceptable. Leakage rate can be up to 0.5% of the maximum valve capacity (Class II shut-off).

Single-Seated Balanced Valves (optional) are used for intermittent Cooling Applications where tighter shut-off is required. Leakage rate is approximately 0.01% of the maximum capacity (Class IV shut-off).

MIXING & DIVERTING

3-Way Valves

3-Way Valves are used for mixing two flows together, or for diverting a flow to or around a device (bypass). In order to produce consistent flow quantity for stable operation, the pressure drop across both flow paths (inlet to outlet) must be nearly equal. The Sleeve-Type (common port on the bottom) is most commonly used for diverting applications; however, due to its design, it can also be used for mixing applications (NOT for steam use). It is also suitable for water or glycol type service, up to a maximum temperature of 300°F. A higher temperature O-ring for use with other fluids, such as oil, or for temperatures up to 410°F, is available. Consult factory.

Introduction

HEATING

Regulating Temperature of a Plating or Finishing Tank

Valve Body determines the action of the Regulator
For Heating: use **Normally Open** Valve Body (in-to-close)

COOLING

Using Water to Cool Engine

Valve Body determines the action of the Regulator
For Cooling: use **Normally Closed** Valve Body (in-to-open)

TEMPERATURE
Regulators

Components of a Self-Operated Temperature Regulator

Model W91 Actuator is Non-indicating (without temperature indicating dial).

Model W94 Actuator is equipped with an integral dial thermometer to indicate sensing bulb temperature. The W94 displays the temperature at the sensing bulb. This allows for easy adjustment of the temperature set-point, as well as continuous monitoring of the application, without the installation of an additional thermometer.

The thermometer has a 3 1/2" diameter dial face and can be rotated and tilted for maximum readability.

The **Sensing Bulb and Capillary** are available in either Copper (for best heat transfer) or Stainless Steel (for corrosive applications). The capillary tubing is protected by stainless steel flexible armor to resist damage during handling and installation. The sensing bulb is also available with an optional Teflon or Kynar coating; used for special corrosive applications such as plating tanks where stainless steel may not be acceptable.

Capillary lengths up to 24 feet are considered standard; non-standard lengths up to 52 feet are available. Longer capillary lengths require longer bulb length to contain the additional actuating fluid required (see selection chart).

Valve Body

Single-seated balanced valves are used on heating applications (most commonly steam) where tight shut-off is required; also available as an option for cooling applications. Double-seated valves are used on cooling applications because of the high flow rates often required. The balanced double-seated design also allows the temperature actuator to operate with higher differential pressures than would be possible using single-seated non-balanced valves. 3-way valves are used for mixing and diverting applications.

Actuator Housing Assembly

The housing consists of a cap and yoke constructed from precision die cast aluminum. This assembly ensures permanent alignment with the valve body, while protecting the bellows assembly. The yoke includes a set-point scale used to reference the setting of the temperature adjustment screw. The entire housing is finished in a corrosion resistant, baked grey epoxy.

Actuator Bellows & Spring Return Assembly

The accordion type bellows is corrosion resistant to provide accurate response for the life of the regulator. An adjusting bar is provided to turn the brass temperature adjustment screw, which compresses or expands the range adjustment spring, thereby setting the control-point of the unit.

Valve Body & Connection Type

W91/W94 Temperature Regulators available with NPT connection, Integral Union (with NPT connection) and Flanged.

Valve Trim

Valve Trim is composed of the plug and seat(s). Single and double-seated valves employ a stainless steel, tapered plug for enhanced modulation. The valve plug is both top and bottom guided to ensure positive seating alignment. 3-Way valves use a stainless steel sleeve and brass seating surface to change flow direction within the body.

Packing

Valves feature a self-energizing (spring-loaded) Teflon V-Ring packing, which reduces leakage around the valve stem. V-Ring packing is spring loaded to maintain proper compression and does not require manual adjustment.

Introduction • Design & Operation

Sensing Bulb & Thermowells

Sensing Bulb

Sensing Bulb Installation

Care must be taken to ensure that the entire length of the sensing bulb is immersed into the medium at the sensing location. Partial immersion of sensing bulb in the process fluid can result in faulty control.

The sensing bulb is designed to be installed in either a horizontal or vertical orientation (with the tip down). If the tip must be installed upwards, please specify when ordering, as a special bulb construction is required. The sensing bulb material is available in either copper (best heat transfer) or stainless steel (corrosion resistant) and must be compatible with the process fluid, or an optional thermowell can be used for complete isolation of the sensing bulb from the process fluid.

Installed in Pipe Line:

Drawing shows Sensing Bulb installed in a 1" NPT pipe fitting. 1 1/4" is minimum pipe size for adequate clearance around sensing bulb.

TEMPERATURE
Regulators

Sensing Bulb with Thermowell

Thermowell (isolates sensing bulb from process fluid)

Thermowells isolate the sensing bulb from the process fluid. For applications in which the process media may be corrosive or contained under excessive pressure, the use of a thermowell is required to prevent damage to the sensing bulb. A thermowell also allows the removal of the sensing bulb without having to drain liquid from the system. Thermowells are available in either brass (best heat transfer) or stainless steel (for corrosive applications). The 1 1/4" NPT hub of the thermowell can be installed into the side of a tank or female pipe connection, depending on the application. Three different length thermowells are available to match sensing bulb lengths.

To ensure minimum response time, Heat Transfer Paste (supplied with thermowell) should be applied to the sensing bulb prior to installation.

Temperature Range

Nominal ranges from 20°F (-10°C) through 440°F (225°C) are available. The nominal range defines the entire temperature range of the unit. The service conditions and choice of valve style and action will determine the actual operating range (recommended working span) of the unit. Using the valve in the recommended working span improves temperature response time of the system. The nominal range should be selected so that the set-point falls within the recommended working span for the specified valve style and action. They include an over-range protection spring, which allows the sensing bulb to be heated 100°F above the upper limit of the unit's nominal range for system cleaning or temporary situations.

Accuracy

The W91/W94 Temperature Regulator is a "set-and-forget" regulating device. Once the proper control-point setting has been achieved, the unit requires virtually no adjustments and very little maintenance. Control-point accuracy is dependent upon the sensing bulb location, load change size and speed, and valve size. The sensing bulb must be installed in an area within the process that is most representative of overall process conditions. Care should be taken not to locate the bulb in close proximity to the valve, as the regulator might respond to temperature changes before the process has had time to reach the control-point. Where sudden or large load changes occur, a pneumatically or electrically-powered Control Valve should be specified. Consult the Control Valves section of this catalog.

Valve sizing also plays a major part in regulator performance. A valve that is too small will not be able to provide the desired capacity during peak load conditions, while a valve that is too large may overshoot the control-point and operate with the valve plug too close to the seat, resulting in undue wear of the plug and seat. As part of a well-designed system, a properly sized valve (operating in the 60-90% open position) can control to within 2 to 5 °F.

Size

The proper sizing of a regulating valve is one of the most important factors in its selection. A valve that is too small will not be able to provide the desired capacity during peak load conditions, while a valve that is too large may overshoot the control-point and operate with the valve plug too close to the seat, resulting in premature wear of the plug and seat. The valve coefficient (Cv) is used to determine the maximum capacity of a valve. From this value, a valve body with the appropriate port size can be selected. Port sizes from 1/8" through 4" and connection sizes from 1/2" through 4" are available. Consult the Valve Selection section of this catalog.

Close-Off

Temperature Regulators are not considered shut-off valves. A pressure surge may force a single-seated valve plug open. The W91/W94 Temperature Regulator is a balanced equilibrium system and may not provide the force necessary to tightly seat the valve plug. A separate power-driven or hand-actuated valve is required to ensure tight shut-off when necessary.

W94 Heating Fuel Oil to Proper Temperature

When the Sensing Bulb is mounted remotely from the actual point of heating (as shown) the Circulation Pump MUST continue to run so that the sensing bulb can sample the product temperature in the heat exchanger. Without product circulation, the temperature control valve will never shut off and the oil will be overheated

W94 Elevating Temperature of a Plating or Finishing Tank

Sensing bulb should be properly placed inside tank for best temperature consistency. An optional Thermowell (Stainless Steel or Brass) may slightly reduce temperature sensitivity. However, it will isolate sensing bulb and allow for its removal without draining the tank.

Introduction

Typical Applications for Temperature Regulators for Heating & Cooling

W94 Used in a Drying Oven Application

W94 Valve used to regulate the temperature of the air flow through an air heating duct. The sensing bulb is installed toward the end of the heating duct and will sense the temperature of the air flowing past the heating coils. When air temperature is below the set point, the valve will open to allow more steam through to the coils to heat the air passing through the duct. Once the desired air temperature is achieved, the valve will begin to modulate closed to maintain the air temperature.

TEMPERATURE
Regulators

W91 Used to Reduce Oil Temperature In a Heat Exchanger

W91 Cooling valve controlling the flow of water through a heat exchanger to maintain the temperature of oil that is gaining heat by some process. The valve automatically shuts off when not required, greatly reducing cooling water usage. The source of the cooling water may be a well or city water supply and it can be circulated or dumped to drain. A 3-way valve may be used on cold water chiller systems so flow can be diverted from going through the heat exchanger when not required.

W91 Used to Control Water Flow to Air Compressor for Cooling Purposes

When the Sensing Bulb is mounted remotely from the actual point of Cooling (as shown), the water **MUST** continue to flow so that the sensing bulb can sample the product temperature of the unit being cooled. Without continuous water flow, the temperature control valve will never turn on, causing the unit to overheat. The bypass line provides a minimum continuous flow when temperature set point is achieved and the valve is closed.

Direct-Operated Regulators

Temperature Regulators

W91/W94 Series

For **Heating** & **Cooling**

Model	W91 (No Indicating Dial) W94 (Temperature Indicating Dial)	
Service	Water, Steam, Other Liquids	
Sizes	1/2" – 4"	
Connections	Threaded, Union Ends, 125# FLG 250# FLG (optional)	
Body Material	1/2" – 2"	Stainless Steel (Class IV)
	1/2" – 2"	Bronze (Reverse-acting Class II)
	2 1/2" – 4"	Cast Iron
Seat Material	Stainless Steel	
Max Inlet Pressure	250 PSIG	

TEMPERATURE
Regulators

Typical Applications

The **W91** & **W94** Self-Operating Temperature Regulators are the preferred choice of original equipment manufacturers, mechanical contractors and specifying engineers. They require no external power source and are ideal for regulating the temperature of tanks, process streams and various types of industrial equipment. The Actuator is noted for its rugged die-cast aluminum housing, fully-enclosed bellows assembly and internal over-temperature range protection.

Model **W91**

Non-Indicating (without indicating dial) features a lower profile and should be specified where space constraints may be an issue.

Model **W94**

Temperature Indicating (with indicating dial) will allow the operator to verify the process temperature and to aid in temperature adjustment.

Features

- Self-Operating (no external power source required)
- Temperature Indicating & Non-Indicating models available
- Heavy Duty Die-Cast Aluminum Housing
- 1/2" thru 4" Valve Sizes
- Fully Enclosed Bellows
- Temperature Over-range protection spring to protect thermal system

Specifications

Dial Thermometer:	3 1/2" dial, stainless steel case, swivel and angle adjustment (Model W94 only)
Housing:	Die-cast aluminum, epoxy powder coated grey finish
Bellows:	High-pressure brass, corrosion resistant, tin plated finish
Temperature Over-range Protection:	Protects Thermal System from damage up to 100°F over high limit of range

Temperature Regulator Valve Action

Application	Stem Action	Normal (Fail) Position
Heating	In-To-Close	Normally Open
Cooling	In-To-Open	Normally Closed

How to write proper model number:

Explanation of Model Number:	W91	06	08	S15	H13N
	Model	Temp. Range	Cap. Length	Bulb Type	Valve Body
Model Number:	W91-06-08-S15-H13N				

Model Code Configuration

Models	Temperature Range	Capillary Length	Sensing Bulb	Valve Body Selection
W91 Non-Indicating	01 – 14 Refer to Temperature Range Chart	08 8 Feet (standard)	S15 Brass bulb (standard)	Refer to Valve Body Section (Omit this selection if purchasing Actuator only)
W94 Indicating Dial		12 12 Feet		
		16 16 Feet		
		20 20 Feet		
		24 24 Feet		
			S16 Stainless bulb	
			SB15 9" Brass bulb	
			SB16 9" Stainless bulb	

Note: Thermowells are ordered separately. See Thermowell & Bulb Connections page.

W91 Non-Indicating Actuator

W94 Temperature Indicating Actuator

Dimensions: inches [mm]
Actuator Weight: 6 lbs.

Description of Working Span

The recommended working span typically falls within the upper third of the nominal range. Single-Seat In-To-Close, all Double-Seat, and all 3-Way valves have a recommended working span in this part of the nominal range. Using the valve in the recommended working span improves temperature response time of the system.

Temperature Range Chart

W91 & W94 Actuators				
Range Code	Nominal Range		Recommended Working Span *	
01	20 to 70 °F	-10 to 20 °C	40 to 65 °F	5 to 20 °C
02	40 to 90 °F	5 to 30 °C	65 to 85 °F	20 to 30 °C
03	30 to 115 °F	0 to 45 °C	85 to 110 °F	30 to 45 °C
04	50 to 140 °F	10 to 60 °C	110 to 135 °F	45 to 60 °C
05	75 to 165 °F	25 to 70 °C	135 to 160 °F	60 to 70 °C
06	105 to 195 °F	40 to 90 °C	160 to 190 °F	70 to 90 °C
07	125 to 215 °F	55 to 100 °C	190 to 210 °F	90 to 100 °C
09	155 to 250 °F	70 to 120 °C	210 to 245 °F	100 to 120 °C
10	200 to 280 °F	95 to 135 °C	245 to 275 °F	120 to 135 °C
11	225 to 315 °F	110 to 155 °C	275 to 310 °F	135 to 155 °C
12	255 to 370 °F	125 to 185 °C	305 to 365 °F	155 to 185 °C
13	295 to 420 °F	145 to 215 °C	365 to 415 °F	185 to 215 °C
14	310 to 440 °F	155 to 225 °C	415 to 435 °F	215 to 225 °C

*Note: The recommended working span typically falls within the upper third of the nominal range.

Select range so that desired set temperature is within the Recommended Working Span

SENSING BULB & CAPILLARY Selection

Sensing Bulb Selection & Installation:

The sensing bulb and capillary are available in Copper (best heat transfer properties) or Stainless Steel (for corrosive applications). Copper has better heat transfer properties than stainless steel and should always be chosen for better temperature control unless used in corrosive service. The length of the sensing bulb is dependent upon the capillary length required (see chart). Longer capillary lengths require a longer length sensing bulb to operate the regulator. For installation, the Union Hub is threaded into a tank or piping system. The bulb slides through the Union Hub and is held in place by the Union Nut which spins freely around the armored capillary and threads into the Union Hub. The angled surface of the sensing bulb forms a metal-to-metal seal on the inner edge of the Union Hub to prevent leakage of the process fluid.

Thermowell Option (ordered separately)

A thermowell isolates the sensing bulb from the process fluid. It can be used to remove the sensing bulb while the system is filled with fluid or to protect the sensing bulb from corrosive liquids or excessive system pressures (see following page).

Sensing Bulb & Capillary						
ORDER CODE	Sensing Bulb Material	Capillary Tubing Material		Capillary Length in Ft.		
				8, 12, 16	20	24
S15	Copper (Brass Union Hub) 13" Copper Bulb is standard	Copper with Stainless Steel Spiral Armour	A	13"	16"	20"
			U	12.25"	15.25"	19.25"
S16	Stainless Steel (Stainless Steel Union Hub)	Stainless Steel with Stainless Steel Spiral Armour	A	13"	16"	20"
			U	12.25"	15.25"	19.25"
SB15	Copper (Stainless Steel Union Hub) 9" Copper Bulb	Copper with Stainless Steel Spiral Armour	A	9"		
			U	8.25"		
SB16	Stainless Steel (Stainless Steel Union Hub) 9" Stainless Steel Bulb	Stainless Steel with Stainless Steel Spiral Armour	A	9"		
			U	8.25"		

For SDWA Compliance (Safe Drinking Water Act) of bulb and connection, use Suffix Code SDWA.

Example Model Code: W91-05-12-SB15-H16N-SDWA

Other Options available. Consult Factory.

SENSING BULB inside OPTIONAL THERMOWELL

Thermowell Option (ordered separately)

Thermowells isolate and protect the sensing bulb from the process fluid, and are available in either Brass (best heat transfer) or Stainless Steel (for corrosive applications). Thermowells allow for sensing bulb removal and replacement without having to drain liquid from the system. To maintain the best temperature control, always use a Copper Sensing bulb as opposed to a Stainless Steel sensing bulb. For corrosive applications, Stainless Steel thermowells (with a copper sensing bulb) can be used. Thermowells are also recommended for applications with excessive system pressures or extremely turbulent flow to protect the sensing bulb from damage.

Thermowell Length must be selected based on the length of the sensing bulb. The sensing bulb length is based on the length of the Capillary used in the Thermal System. Longer capillary lengths require a longer sensing bulb to hold the additional actuator fluid inside the sensing bulb. Reference Sensing Bulb Chart for sensing bulb length.

THERMOWELLS - Model Numbers & Lengths

Bulb Code	Capillary Length (ft.)	Bulb Length Required (U)	Thermowell Length (ft.)	Connection Size NPT	Model #	Stainless Steel Model #
S15 or SB16	8', 12' or 16'	12.25"	13.0"	1 1/4"	W536S2	W536S6
Special	20'	15.25"	16.0"	1 1/4"	W536SE2	W536SE6
Special	24'	19.25"	20.0"	1 1/4"	W536WE2	W536WE6
SB15 or SB16	8', 12' or 16'	8.25"	9.0"	1"	W535M2	W535M6

- Notes: 1) Thermowell Length chosen is based on the Sensing Bulb Length and the Capillary Length used in the Thermal System. (See chart)
 2) To ensure minimum response time, Heat Transfer Paste (supplied with Thermowell) should be applied to sensing bulb prior to installation.
 3) "U" dimension is Sensing Bulb Length.

The Thermowell isolates the sensing bulb from the process liquid and allows for easy and safe removal of the sensing bulb. For applications in which the process media may be corrosive or contained under pressure, the use of a thermowell is required to prevent damage to the sensing bulb. For corrosive applications, use a stainless steel thermowell & copper sensing bulb. To ensure minimum response time, Heat Transfer Paste should be applied to the sensing bulb prior to installation into the thermowell.

*Note: Bulb diameter for 9" Bulb is 3/4" and the Union Hub is 1" NPT.

For custom 3/4" Union Hub, consult factory.

HEATING

TEMPERATURE
Regulators

HEATING WATER: The amount of steam required to heat water can be found using chart above.

Example: To heat 1000 gallons per hour of water from 40°F to 140°F (Temp. increase 100°F) requires 830 lbs/hr of steam.

HEATING FUEL OIL: The amount of steam required to heat fuel oil is half of that to heat water. Use half the value found in chart above.

Example: To heat 1000 gallons per hour of fuel oil from 40°F to 140°F (Temp. increase 100°F) requires 415 lbs/hr of steam.

Capacity Formulas for Steam Loads

When Heat Load or Heat Transfer Rate (E) is Known	Capacity of steam required (lbs/hr)	= $\frac{E \text{ (Btu/hr)}}{1000}$
When Square Feet Equivalent Direct Radiation (EDR) is Known	Capacity of steam required (lbs/hr)	= $\frac{\text{Sq. ft. of EDR}}{4}$
When Heating Water with Steam	Capacity of steam required (lbs/hr)	= $\frac{\text{GPM} \times \text{Temp Rise (°F)}}{2}$
When Heating Fuel Oil with Steam	Capacity of steam required (lbs/hr)	= $\frac{\text{GPM} \times \text{Temp Rise (°F)}}{4}$
When Heating Air with Steam Coils	Capacity of steam required (lbs/hr)	= $\frac{\text{CFM} \times \text{Temp Rise (°F)}}{900}$

Note: Above formulas based on steam containing approximately 1000 Btu's of Latent Heat per pound.

COOLING

Model Codes in Chart are for complete Temperature Regulators.
This includes the Valve Body and Thermal Actuator with standard copper bulb and 8 ft. capillary.

W91

Non-Indicating Type Actuator
with valve body

X = Temperature Range
08 = Capillary Length 8 ft.
S15 = Copper Bulb

Note: Thermowells for Models W91/W94 are ordered separately.

Replacement Actuator Model Configuration

Example Model Code configured: **W91-05-12-S15**

Models	Temperature Range = X	Capillary Length	Bulb
W91 W94	01 – 14 (Refer to Temperature Range Chart)	08 8 Feet (std) 12 12 Feet 16 16 Feet 20 20 Feet 24 24 Feet	S15 Copper Bulb (with Brass Union Hub) S16 Stainless Steel Bulb (with SS Union Hub)
W91	05 (75 - 165°F)	12	S15

Thermowells for W91 & W94 Series Self-Operated Temperature Regulators

Capillary Length (ft.)	Bulb Length Required	Thermowell Length (in.)	Connection Size NPT	Brass Model #	Stainless Steel Model #
8', 12' or 16'	12.25"	13.0"	1 1/4"	W536S2	W536S6
20'	15.25"	16.0"	1 1/4"	W536SE2	W536SE6
24'	19.25"	20.0"	1 1/4"	W536WE2	W536WE6
8', 12' or 16'	8.25"	9.0"	1"	W535M2	W535M6

Notes: Thermowell Length chosen is based on the Length of the Capillary used in the Thermal System. (See chart above)

*3/4" connection available on thermowell for 9" bulb; Consult factory.

for Freeze Protection

Model	AMBI-REG
Service	Steam, Water, Other Liquids
Sizes	1/2" – 1"
Connections	Threaded, Union Ends
Body Material	Bronze, Stainless Steel
Seat Material	Stainless Steel
Max Inlet Pressure	250 PSIG

Typical Applications

The **AMBI-REG Temperature Control Valve** opens and closes based on ambient temperature. Therefore, it is ideal for automatic control of steam tracing lines in the winter months when flow is needed for freeze prevention and protection of outdoor pipelines, storage tanks, and plant instrumentation. It can also be used for freeze protection of outdoor water pipelines. Opening and Closing of Regulator is based on ambient temperature, it automatically opens and closes only when steam or water flow is needed, significantly reducing energy usage.

Features

- Self-contained, ambient sensing design requires no additional sensing bulb or element, simplifying installation (no external power source required)]
- Specially-designed Thermal Actuator Housing dissipates heat from nearby piping and equipment for true sensing of ambient conditions
- Lifetime lubrication is incorporated in the adjustment bushing minimizing maintenance
- Rugged industrial design with corrosion-resistant materials suitable for extended outdoor service life

Typical Applications

Housing:	Glass-Filled Nylon Yoke, Die-Cast Aluminum Cap, PEEK Bushings
Bellows:	High-pressure brass, corrosion resistant, tin plated finish
Temperature Over-range Protection:	Protects Thermal System from damage up to 100°F over high limit of range

How it Works

The fully self-contained regulator requires no external power source and can be field-adjusted to an ambient set temperature appropriate for opening & closing based on the application requirements. The thermal actuator assembly houses a fully enclosed bellows which senses and responds to ambient temperature. Turning the temperature adjustment screw clockwise increases set temperature and counter-clockwise for reducing set temperature.

Control Valves

HB-Series

Watson Mc Daniel HB-Series Control Valves

- 2-Way and 3-Way Valves
- Sizes: 1/2 - 4"
- Threaded (NPT/BSPT) and Flanged (ANSI/DIN)
- Stainless Steel Bodies
- Pneumatically-Actuated and Electrically-Actuated

A **Control Valve** is a device capable of modulating flows at varying degrees between minimal flow and full capacity in response to a signal from an external control device to the valve's actuator. The valve modulates flow through movement of a valve plug in relation to the port(s). The actuator, which can be pneumatically or electrically operated, directs the movement of the stem as dictated by the external control device.

2-Way Valves

2-Way Valve
(shown with)

2-Way Valve
(shown with)
Electric-Actuator

3-Way Valves

3-Way Valve
(shown with)
Pneumatic-Actuator

Options & Accessories:

Controller, Positioners, I/P Transducers, Air Regulator, Temperature Sensors & Noise Attenuation

A **Control Valve** is one component of a control loop and relies upon other components for proper function of operation (i.e. controller, sensor, transducer, etc.).

Control Valves with PNEUMATIC Actuator

HB-Series 2-Way Valve
shown with
Air Filter & Positioner

For **HEATING** applications, a **Normally-Closed/Air-to-Open (ATO)** Valve should be selected. If the Pneumatic Signal to the actuator is interrupted, the valve will automatically fail in the closed position to prevent overheating.

For **COOLING** applications, a **Normally-Open/Air-to-Close (ATC)** Valve should be selected. If the signal to the actuator is interrupted, the valve will automatically fail in the open position to prevent overheating.

The **Max Close-Off Pressure (PSI Δ P)** of the valve must exceed the inlet pressure to the valve or the valve will not operate. See Max (PSI Δ P) Chart. In applications where the Maximum Close-Off Pressure of the valve is insufficient, a **Valve Positioner** can be utilized to increase the close-off pressure capability of the valve.

Selecting the correct size valves requires using the capacity charts or specialized sizing software which can be made available by the factory. Proper sizing of the control valve is an important aspect of the selection process. Be careful to not oversize the valve. See Engineering Section for more detailed information on valve selection.

Control Valves with ELECTRIC Actuators

The **HB Series** Stainless Steel 2-Way Control Valve with **Electric Actuator** is a robust, user-friendly alternative to the Pneumatically-Actuated unit. It is ideal for installations where an instrument air source is not available. Electric Actuators utilize either **Super Capacitors** or **Springs** to fail-safe in the event of power loss or signal failure.

E-Series

On the **E-Series Electric Actuator** there is a choice between using **Super Capacitors (EC Model)** or **Spring Return (ES Model)** as the power source to return the valve to an open or closed position in the event of signal or power failure.

When ultra-fast response times are required, the **EC Actuator** with its ability to fully-cycle the valve in as little as 6 seconds, should be selected.

SK-Series

The **SK Actuator** is for general purpose use and is only available with fail-closed spring return. These actuators may require 30 seconds to fully stroke the valve. **2-Way Valves with SK Actuators fail-closed in the event of power failure.**

E-Series Electric Actuator

2-Way Valve
with
Fast-Acting EC Actuator
uses Capacitors as power source
for Fail-Safe Mode

2-Way Valve
with
ES Actuator
uses Springs as power source
for Fail-Safe Mode

SK-Series Electric Actuator

2-Way Valve
with
SK Actuator
Economical Model uses Springs as
power source to Fail in the Closed position

3-Way Valves

with **PNEUMATIC** or **ELECTRIC** Actuators

A 3-Way Control Valve is used for either **Mixing** or **Diverting**. In a **Mixing** application, two separate liquid streams are mixed together in a desired proportion.

In a **Diverting** application, a single incoming stream is split into two separate streams. A typical example of this is a Bypass application. In order to produce a consistent flow for stable operation, the pressure drop across both flow paths (from inlet to outlet) must be nearly equal.

3-Way Valves are ONLY used for liquid applications.

Mixing: Ports "A" and "B" are Inlets
Port "AB" is Outlet

Diverting: Port "AB" is Inlet
Ports "A" and "B" are Outlets

3-Way Valve

2-Way Valves with PNEUMATIC ACTUATORS

Pages 320-323

The **HB Series** Stainless Steel 2-Way Control Valves are made to withstand the rigorous nature of **steam and water service** and are compatible with most other fluids as well. The standard configuration has an equal percentage flow characteristic with metal-to-metal seating, spring-loaded Teflon V-ring stem packing.

The Pneumatic Actuator is controlled by a 3-15 PSIG standard instrument air signal that will modulate the position of the valve. The Actuator can be specified to operate the valve for either **Air-To-Open (Normally Closed)**, typical for **HEATING** applications) or **Air-To-Close (Normally Open)**, typical for **COOLING** applications). Fail-safe Mode can also be re-configured in the field if needed.

2-Way Valves with **Pneumatic** Actuator
1/2" - 4" • Threaded & Flanged

3-Way Valves with PNEUMATIC ACTUATORS

Pages 324-327

The **HB Series** Stainless Steel 3-Way Control Valves are used for **mixing** two liquid streams, or for **diverting** the flow of a single liquid stream into two streams (bypass).

The disc type design is constructed of Stainless Steel for extended service life.

Teflon seat rings are available for increased shut-off tightness or for water or glycol type service, up to a maximum of 450°F.

3-Way Valves with **Pneumatic** Actuator
1/2" - 4" • Threaded & Flanged

CONTROL
VALVES

Valve Positioner – Pneumatic or Electro-Pneumatic

Pages 328-331

Valve positioners improve control accuracy and increase maximum close-off pressure capability of the valve. The Positioner is mounted to the valve's yoke assembly and linked to the valve stem. It receives a transduced air signal or direct electrical signal from the electronic controller and compares the control signal to the actual position of the valve plug. The Positioner then sends a corrected air signal to the valve's actuator, thereby positioning the valve plug for optimum flow modulation. Available options include **Intrinsically Safe**, **Explosion-Proof** and **Digital** designs.

2 & 3-Way Valves with ELECTRIC ACTUATORS

Pages 332-337

The **HB Series** Stainless Steel 2 & 3-Way Control Valves with **Electric Actuators** are robust, user-friendly alternative to the Pneumatically-Actuated unit. Ideal for installations where an instrument air source is not available. The **E-Series Actuators** utilize either **Capacitors** or **Springs** in order to fully-open or fully-close the valve in the event of signal or power failure. The **SK-Series Actuator** uses springs to Fail in the Closed position in the event of power failure.

E-Series Electric Actuators for 2 & 3-Way Valves

Why use E-Series Actuators?

When Ultra-fast response times are needed, the **EC Model** with **Super Capacitors** should be selected. Unit cycles from Open-to-Close in approximately 6 seconds.

When medium response times are adequate, the **ES Model** with **Spring Return Actuators** is a more economical choice.

2-Way Valves

**Super Capacitor
Fast-Acting
Actuator
EC**

**Spring Return
ES**

3-Way Valves

**Super Capacitor
Fast-Acting
Actuator
EC**

**Spring Return
ES**

SK-Series Electric Actuators for 2 & 3-Way Valves

The **SK Series Electric Actuators** are an economical choice for **Heating, Boiler Feed Water**, as well as **On/Off HVAC Steam Control** where extremely fast response times are not required.

These Electric Actuators utilize **Spring Return** to retract the stem which allows 2-Way valves to fail fully-closed or 3-Way valves to fail with the "A" Port fully-closed (refer to diagram) in the event of power loss or signal failure.

2-Way Valves

3-Way Valves

Orifice Plates- Sound Attenuation **Page 341**

Control Loop Explanation **Pages 342-343**

TR890 Series Electronic PID Controllers **Pages 344-349**

The TR890 Series Electronic PID Controller is the user-interface which allows adjustment of the set point and controls the electrical signals received from the sensor and outputted to the I/P Transducer or directly to an Electro-Pneumatic Valve Positioner or Electric Actuator. The TR893 is the most common controller model due to its larger, more user-friendly size.

The NANOADAC Series is a PID Controller with added features such as data recording and Modbus Communications (BACnet is optional).

I/P Transducer, Air Filter/Regulator & Electronic Temperature Sensors **Page 350-352**

TA901 Electro-Pneumatic (I/P) Transducer

The TA901 is an electro-pneumatic transducer that converts an electrical signal (4-20 mA) from the Controller to an air signal (3-15 PSIG) for supply to the control valve Actuator or valve Positioner.

TA987 Air Filter & Regulator

The TA987 is recommended for filtering and regulating the pressure of plant compressed air, and for delivering clean, dry air at the proper pressure to pneumatic control devices. The filtering element removes particles as small as 5 microns.

TDD & TMD - 100 Ω & 1000 Ω RTDs

TJD & TKD - Type J & Type K Thermocouples

Both RTD (Resistance Temperature Device) and Thermocouple sensors are available options. These devices sense the temperature of the fluid or product being heated or cooled and transmit an electrical signal to the PID controller.

76 Series Thermowells for RTD & Thermocouple Temperature Sensors **Page 353**

Thermowells are used for applications where the process media may be corrosive or contained under pressure – to prevent damage to the sensor and to facilitate removal of the sensor from the process. To prevent leakage of the process fluid, spring-loaded sensors must always be installed in a thermowell.

2-Way Valve with Pneumatic Actuator

for HEATING • COOLING • FLUID TRANSFER • Steam, Air, & Water

2-Way • 1/2" – 4"

Description & Operation

A control valve is a device capable of modulating flow at varying degrees between minimal flow and full capacity in response to a signal from an external control device. The valve modulates flow through movement of a valve plug in relation to the port(s) located within the valve body. The valve plug is attached to a valve stem, which, in turn, is connected to the actuator. The actuator, which can be pneumatically or electrically operated, directs the movement of the stem as dictated by the external control device.

Options & Associated Control Loop Accessories

- Positioner: Pneumatic, Electro-Pneumatic or Explosion-Proof
- PID Electronic Controllers (TR890 Series)
- I/P converters (Model TA901)
- Air Filter Regulators (Air Sets-Model TA987)
- Thermocouples
- RTD's
- Pressure Transmitters

NPT	497 PSIG @ 450°F
150# FLG	182 PSIG @ 450°F
300# FLG	497 PSIG @ 450°F

Typical Applications

The **HB Series 3-Way** valves are used for **mixing** two separate liquid streams, or for **diverting** the flow of a single liquid stream (bypass). In order to produce a consistent flow for stable operation, the pressure drop across both flow paths (inlet to outlet) must be nearly equal. The valve plug is constructed of stainless steel for extended service life. A Teflon plug option is available for increased shut-off tightness or for water or glycol type service, up to a maximum of 450°F.

Description & Operation

A control valve is comprised of an actuator mounted to a valve. The valve modulates flow through movement of a valve plug in relation to the port(s) located within the valve body. The valve plug is attached to a valve stem, which, in turn, is connected to the actuator. The pneumatic actuator directs the movement of the stem as dictated by the external control device.

Mixing:

Ports "A" and "B" are Inlets
Port "AB" is Outlet

Diverting:

Port "AB" is Inlet
Ports "A" and "B" are Outlets

3-WAY VALVES ARE NOT FOR USE WITH STEAM

CONTROL
VALVES

CE100 Series Electro-Pneumatic Positioners

for 2-Way or 3-Way Pneumatically-Actuated Valves

**Valve Positioners (Electro-Pneumatic)**

The **CE100 Series Electro-Pneumatic Positioners** improve control accuracy and increase maximum close-off pressure capability of the valve. The Positioner is mounted to the valve's yoke assembly and linked to the valve stem. It receives a transduced air signal or direct electrical signal from the electronic controller and compares the control signal to the actual position of the valve plug. The Positioner then sends a corrected air signal to the valve's actuator, thereby positioning the valve plug for optimum flow modulation.

The **Electro-Pneumatic Positioner** receives an electrical 4-20 mA signal directly from the PID Controller and therefore eliminates the need for a separate I/P Transducer.

CONTROL VALVES

	Electro-Pneumatic CE100
Input Signal	4-20 mA

V100 Series Pneumatic & Electro-Pneumatic Positioners

for 2-Way or 3-Way Pneumatically-Actuated Valves

**Valve Positioners (Pneumatic or Electro-Pneumatic)**

The **V100 Series** Valve Positioners (Pneumatic/Electro-Pneumatic) offer enhanced features ideal for applications where extreme accuracy is required. Designed to mount to a pneumatically-actuated control valve to improve control accuracy and increase maximum close-off pressure capability of the valve.

The **V100P Pneumatic Positioner** receives a 3-15 PSIG air signal normally taken from an I/P Transducer.

The **V100E Electro-Pneumatic Positioner** receives an electrical 4-20 mA signal directly from the PID Controller and therefore eliminates the need for a separate I/P Transducer.

with Gauge Blocks (included)
optional Stainless Steel
50in² Actuator

The **MVP3500** is a digital positioner that mounts to the pneumatic actuator of control valves to improve accuracy and increase maximum close-off pressure capability of the valve. Digital positioners use piezo-electric valves for the air supply which limit leakage, making them much more efficient than electro-pneumatic positioners.

Set-up and calibration are also greatly simplified by the use of local push-buttons and LCD, eliminating the need for expensive handheld devices for basic set up and calibration. The **MVP3500** comes standard with 4-20mV feedback, Hart communication, gauge blocks and gauges.

The **MVP3600** is an Explosion-Proof model.

shown with
D400 Positoner
with Gauge Blocks (included)
optional Stainless Steel
50in² Actuator

The **D400** is a digital positioner with Intrinsically-Safe or Explosion-Proof options. These positioners are designed to be highly accurate and efficient in a wide range of application environments. HART communication and 4-20mA feedback are available as options.

SPECIFICATIONS	
Model	D400
Signal	4-20mA
Feedback	Optional 4-20mA
Supply Pressure	22 - 90 PSIG
Air Consumption	.015 SCFM
Ambient Temperature Range	-40 ° - 185 ° F
Rotation Range	250 ° - 120 ° F
Linear Stroke Range	0.4 - 4.0 in.
Characteristics Curves	Linear ,Eq %, 1:25, 1:50 50:1, Custom
Deadband	0.1% - 10% Adjustable
Communication	Optional HART
Enclosure Rating	NEMA 4X / IP65
Air Connections	1/4" NPT
Electrical Connections	1/2" NPT
D400-IS (Intrinsically Safe)	
ATEX: II 2G EEx ib IIC T6 II 2G EEx ia IIC T6 II 3G EEx n A II T6 II 2D IP 6X T 46 ° C IECEX: EXIB IIC T6	
D400-EX (Explosion-Proof)	
ATEX: II 2G EEx ib IIC T6 IECEX: EXIB IIC T6	

HB Series "SMART" Positioner Options				
Model Code	Features	Weight lbs.	Options	
			Suffix Code	Description
D400	Standard Digital (Single-Action) - No Communication	5	-H	Hart Communication
D400-IS	Digital (Intrinsically Safe) - No Communication	5	V240007	Single Gauge Block
D400-EX	Digital Explosion-Proof - No Communication	5	-FB	4-20mV Feedback
			-HFB	Hart Communication & Feedback

Electric Actuators for 2-Way or 3-Way

Models	2 & 3-Way Valves with E-Series or SK-Series Electric Actuators
Service 2-Way Valve	Steam, Air, Water
Service 3-Way Valve	Liquid ONLY (NO STEAM)
Sizes	1/2" - 4"
Connections	NPT, 150# FLG, 300# FLG
Body Material	316 Stainless Steel
Plug and Seat Material	Stainless Steel (Std.)
PMO Max. Operating Pressure	720 PSIG @ 100°F
TMO Max. Operating Temperature	450°F @ 497 PSIG
Min Operating Temperature	-20°F
Max Air Supply Pressure	50 PSIG
Max Ambient Temperature	Actuator Dependent

DESIGN PRESSURE/TEMPERATURE RATING – PMA/TMA

NPT	497 PSIG @ 450°F
150# FLG	182 PSIG @ 450°F
300# FLG	497 PSIG @ 450°F

The **HB Series** Stainless Steel 2-Way & 3-Way Control Valves with **Electric Actuators** are a robust, user-friendly alternative to the Pneumatically-Actuated unit. They are ideal for installations where an instrument air source is not available or when the benefits for electric actuation are preferred.

Electric Actuators utilize either **Super Capacitors** or **Spring Return** which allow for the valve to fail in either the fully-open or fully-closed position in the event of power loss or signal failure.

The **EC Model** using Super Capacitor should be selected when Ultra-fast response times are needed such as in instantaneous hot water heater applications. The **EC Model Actuator** will cycle from Open to Close in approximately 6 seconds.

The **ES Model** using Spring Return are an economical choice when medium response times are sufficient. They have Fail-Open and Fail-Close options as well as 24 VDC service.

The **SK Series Electric Actuators** are used for general purpose applications where medium response times are sufficient. They are an economical choice for **Heating, Boiler Feed Water** applications as well as **On/Off HVAC Steam Control**.

SK Actuators Fail Closed, typically not used for Cooling applications.

TECHNICAL INFORMATION

Plug Design	Equal Percentage
	Linear
	Soft-Seat
Leakage Rating	ANSI/FCI-70-2 Class IV, VI
Rangeability	50:1
Travel (1/2" - 2" Body)	3/4"
(2 1/2" - 4" Body)	1 1/8"
Body Design Rating	ASME 150/300
Action Options	Fail Open*
	Fail Closed
Actuator Options	Fast-acting, Super Capacitors
	On-Off, Spring Return

* 2-way HB-Series with SK-Series Actuators are Fail-Closed only.

Valve Design conforms to ANSI/ASME B 16.34

* Note: For 2-Way Valves Equal Percentage trim style should be used for steam service.
Linear trim style should be used for water service.

ELECTRIC ACTUATOR OPTIONS

EC Series		ES Series	SK Series	
Heating Resistor for protection in cold outdoor climates	Contact Factory	None	Weather Shield Assembly Kit for outdoor use. UL Listed to meet NEMA 3R rating.	Contact Factory
Communication Kit for field adjustments, data access, etc.	EC-COMM-KIT			
Transformer for 230 VAC Service	Contact Factory		115 VAC Power Adapter	266010

ES ACTUATOR - Spring Fail-Safe				
ESA	Spring-Fail-Closed	1	115 VAC	0 4-20mA
ESB	Spring-Fail-Open	2	24 VAC/DC	1 0-10V
				2 0-20mA
				3 2-10V

SK ACTUATOR - Spring Fail-Safe	
SKD62UA	SK Actuators are standard 24VAC with 4-20mA control signal. For 115VAC, add Power Adapter. 0-10V control signal option can be field set.
SKB62UA	
SKC62UA	

Failure Mode on SK Actuators:

2-Way Valves Fail-Closed.

3-Way Valves close-off the "A" Port.

E-Series Electric Actuators for 2-Way or 3-Way**EC/EC10 Electric Actuator**

Uses Super Capacitors as the Fail-Safe Operator

Extremely Fast Acting

The **EC/EC10 Electric Actuator** are used for High-performance applications such as instantaneous hot water heaters.

ES Electric Actuator

Uses a Spring as the Fail-Safe Operator

Reduced Response Time & Close-Off Pressures

The **ES Electric Actuator** are used where high-speed actuation is not required.

Actuator Specifications	EC			EC10			ES		
Power Supply	115VAC	24VAC	24VDC	115VAC	24VAC	24VDC	115VAC	24VAC	24VDC
Force	1,100 lbs			2,248 lbs			448 lbs

Nominal 1" Travel Time	8 sec			15 sec			60 sec		
Nominal Current (A)	0.66	3.15	2	.84	4	2.5	0.14	.35	
Max Current (A)	0.86	4.1	2.6	1.1	5.3	3.3	0.14	.35	
Max Power Consumption	57	53	48	78	73	61	9	9	
Duty Cycle, IEC 60034-1, 8	S2 30 min S4 50% ED @ 77° F						S2 30min S4-1200c/h-50%ED		

Motor Protection	Electric motor current monitoring with safety cut-off
Set Value Feedback	0 (4)-20mA or 0 (2)-10V selectable, split range operation
Binary Control	24V for On/Off Control (1s min pulse duration)
Valve Positioner Function	Integrated positioner, deadband adjustable from 0.5 to 5%, shutoff min.
Automatic Start-up	Recognizing the end position(s) and autoscaling set and feedback values
Internal Fault Monitoring	Torque, set value, temperature, power supply, positioning deviation, etc.
Diagnostics Function EC-Series ONLY	Stores accumulated operation data (motor & total run time, number of starts) and data of current values (set value, feedback value, torque, temp, and error message)
Communication Interface	USB interface with Software / enables parameter adjustments
Cable Glands	2x M20x1.5 & 1x M16x1.5

The EC Actuator can be factory set or field configurable (with COMM-KIT) as follows:

- Stroke adjustment
- Stroke velocity
- Response time
- Fail-safe direction and position
- Flow characteristic (i.e. equal %, linear, quick open)

Options for EC

Transformer for 230 VAC Service

Limit Switch

Heater Element

SK-Series Electric Actuators for 2-Way or 3-Way**SKB • SKC • SKD****Electric Actuators**

The **SK Series Electric Actuators** are a robust choice for **Boiler Feed Water** applications as well as **On/Off HVAC Steam Control** applications where ***Fail-Closed is required***. For general purpose applications, where medium response times are sufficient. In the event of a signal failure, the stem of the SK Actuator retracts. Therefore the Failure Mode of a 2-Way valve is closed and a 3-Way valve will close off the "A" port.

Actuator Specifications	SKB	SKC	SKD
Power Supply	24VAC		
Force	629 lbs		224 lbs
Velocity	0.006 in/s	0.013 in/s	0.025 in/s
Nominal 1" Travel Time	120	60	30
Nominal Current (A)	.5	.84	.5
Max Current (A)	.5	.84	.5
Max Power Consumption (W)	12	20	12
Agency Certification	UL873, CE 89/336/EEC		

Option:

Power Adapter for 115 VAC Service

Actuator Selection**SKD Series**

Standard for 1/2" to 2" valve bodies where a 30 second stroke time is preferable.

SKC Series

Standard for 2 1/2" to 4" valve bodies and also when higher shut-off pressures are required for 1/2" to 2" valve bodies.

SKB Series

Option for higher shut-off pressure applications where increased stroke time can be tolerated.

2-Way Valves with Electric Actuators

for HEATING • COOLING • FLUID TRANSFER • **Steam, Air, & Water**

2-Way • 1/2" – 4"

**1/2" to 2"
Threaded & Flanged**

**2 1/2" to 4"
Flanged**

Noise Reduction Capability: 5-10+ dBA

The **Series OP** Orifice Plate with its drilled orifice pattern is installed after the pressure regulating valve to smooth out turbulence caused by the pressure drop across the regulator. Typical noise reduction levels of 5-10 dBA; higher possible. Manufactured from SA-105 Carbon Steel, 304 SST, or 316 SST.

Helpful Selection Information

All Orifice Plates are custom designed to optimize noise attenuation and control. They are sized in conjunction with PRVs. Therefore, the following information is required for proper selection: Steam Inlet Pressure to PRV, Reduced Outlet Pressure, and Load/Capacity (lb/hr).

X = Material
 1 = A105 CS
 2 = 304 SST*
 3 = 316 SST*

= Number of Holes
 Factory Determined

0.000 = Diameter of Holes
 Factory Determined

Notes: 1) Other sizes and flange connections available; Consult Factory.
 2) Orifice Plates may be available for other valves; Consult Factory.
 * Consult Factory for SST pricing.

Cavitation Adapters

Cavitation is a condition found in liquid flow through a control valve. The two stage process occurs during the rapid formation and collapse of vapor cavities or bubbles. When the flow through the valve orifice causes a pressure drop below the liquid vapor pressure the cavities form. When the pressure in the valve recovers above the liquid vapor pressure, the vapor bubbles collapse and the energy from the implosion can cause premature wear on the valve near the plug and seat. Cavitation can cause noise, vibration, and damage to control valves.

Valve Size	Valve Cv	Adapter Cv	Combo Cv	Adapter* Part No.	Overall Length
1/2 R	3.5	3.6	2.7	CA121	5.5
		2.4	2.2	CA122	
		1.6	1.9	CA123

Note: Cavitation Adapters available for valve sizes 2 1/2" -4"; Consult factory.

* Specify end connection: NPT, 150# or 300# FLG.

Understanding a Control Loop

Sensor for Temperature Control (Thermocouple or RTD)

Electronic Temperature Sensors are available with both Type J and Type K Thermocouples, as well as RTD sensors. A thermocouple (T/C) is made from two dissimilar metals that generate electrical voltage directly with changes in temperature. An RTD (Resistance Temperature Detector) is a variable resistor that will change its electrical resistance in direct proportion to changes in temperature in a precise, repeatable and nearly linear manner. The weatherproof head provides a conduit connection and can be used to house a transmitter (optional). The stem is either welded directly to the 1/2" NPT threaded connection, or is spring-loaded.

Stem (Sheath)

All Thermocouples and RTDs are furnished with a 316 stainless steel stem, with the internal wiring packed in powdered ceramic. The screw head cover style is available in two stem types: welded and spring loaded. The welded stem is suitable for use in liquid applications. The spring-loaded stem is designed to bottom out inside a thermowell, providing maximum heat sensitivity. Spring-loaded stems are not pressure tight and may allow process media to escape; therefore, they must always be installed in a thermowell.

The insertion length (U) of a thermocouple or RTD represents its depth into the process vessel or thermowell. Thermocouples and RTDs are available in standard U-lengths from 2" to 24". Other lengths are available upon special order; consult factory.

TR890
Series Controller

The user-interface which allows adjustment of the set point and controls the electrical signals received from the sensor and outputted to the I/P Transducer. The TR893 is the most common controller model due to its larger, more user-friendly size.

NANODAC
Series Controller

The NANODAC Series is a PID Controller with added features such as data recording and Modbus Communication. (BACnet is optional.) Standard features include (4) universal analog inputs, (2) 4-20mA outputs, (3) mechanical 2A relays, and 110-230VAC power supply. 24VAC/DC and other options available; Consult factory.

TA901
Electropneumatic (I/P) Transducer

An electro-pneumatic transducer that converts an electrical signal (4-20 mA) from the Controller to an air signal (3-15 PSI) for supply to the top of the actuator of the control valve.

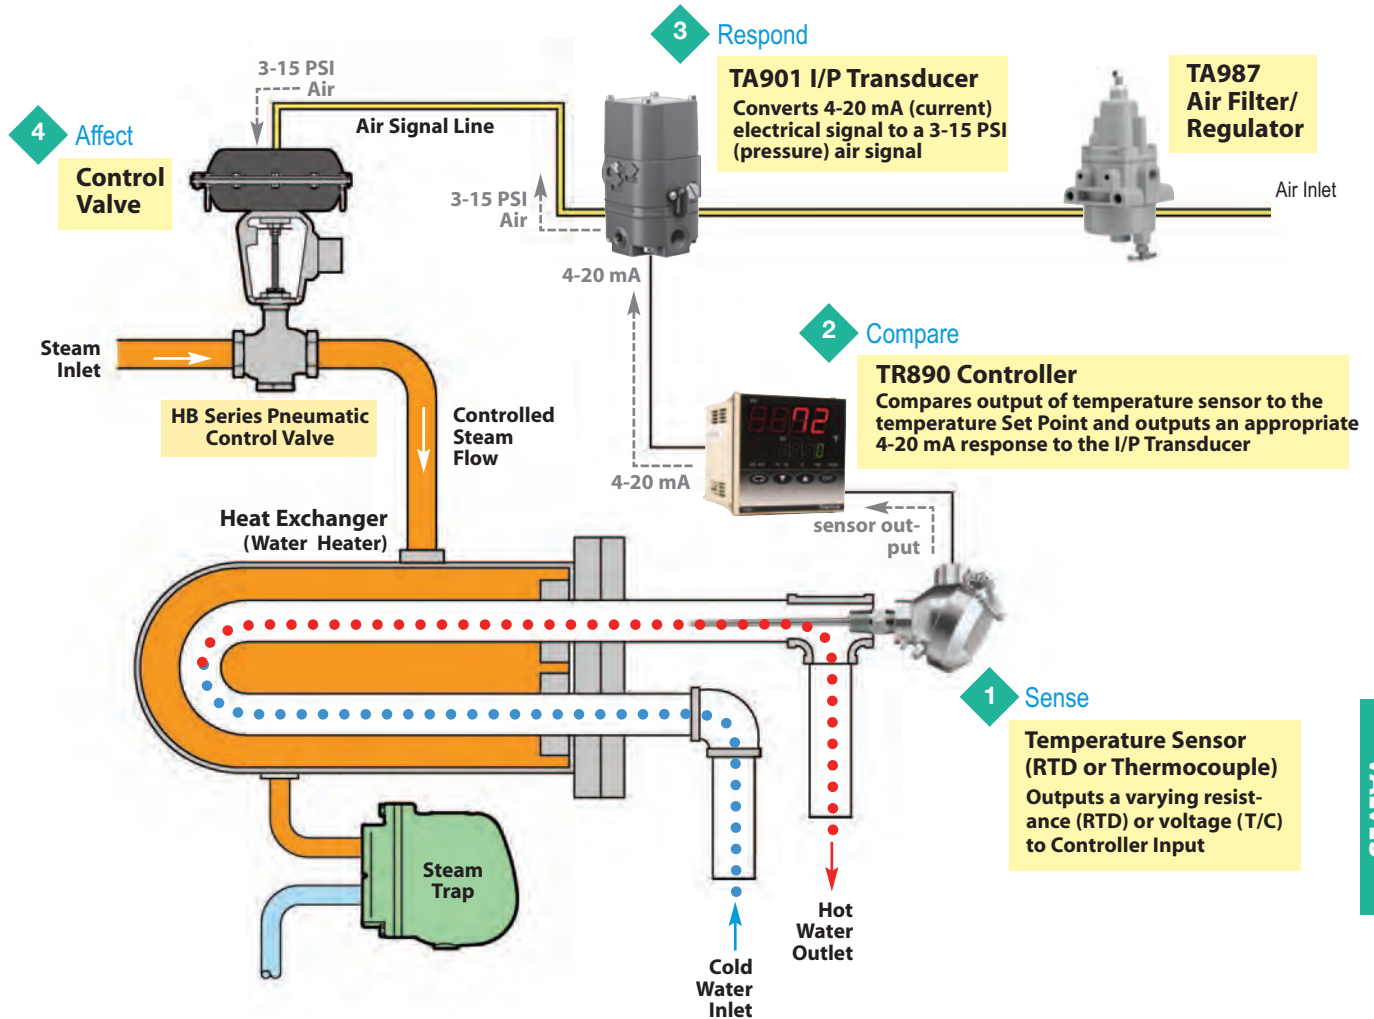

TA987
Air Filter/Regulator

This device is recommended for filtering and regulating the pressure of plant compressed air to the inlet of the I/P Transducer, which ensures the delivery of clean, dry air at the proper pressure to the pneumatic actuator.

Introduction

Understanding a Control Loop

Heat Exchanger (Instantaneous Water Heater)

Control Loop

A control loop is a process management system designed to maintain a process variable at a desired set point. Each step in the loop works in conjunction with the others to manage the system. Once the set point has been established, the control loop operates using a four-step process.

1 Sense

Measure the current condition of the process using a sensor, which can be a thermocouple or RTD transmitter.

2 Compare

Evaluate the measurement of the current condition against the set point using an electronic PID controller.

3 Respond

Reacts to any error that may exist between the measured temperature value and the temperature set point by generating a corrective pneumatic signal.

4 Affect

Actuate the control valve that will produce a change in the process variable.

The loop continually cycles through the steps, affecting the process variable (water temperature) in order to maintain the desired temperature set point.

Design and Operation of an Electronic PID Controller

Description

A controller is a comparative device that receives an input signal from a measured process variable, compares this value with that of a predetermined control point value (set point), and determines the appropriate amount of output signal required by the final control element to provide corrective action within a control loop.

Principle of Operation (Electronic PID Controller)

An electronic sensor (thermocouple, RTD or transmitter) installed at the measurement location continuously sends an input signal to the controller. At set intervals, the controller compares this signal to a predefined set point. If the input signal deviates from the set point, the controller sends a corrective electric output signal to the control element. This electric signal must be converted to a pneumatic signal when used with an air operated valve, such as a Watson McDaniel HB Series Control Valve. The conversion can be made using a Watson McDaniel TA901 I/P Transducer, which converts a 4 to 20 mA electric signal to a 3 to 15 PSI air signal. As an option, a Valve Positioner such as the Watson McDaniel CE100 may be used to send an air signal to the Control Valve. These Positioners can be controlled with a 3-15 psi air signal from a Pneumatic Controller or a 4-20 mA signal from a PID Controller.

Features (Electronic PID Controller)

Watson McDaniel Electronic Controllers have full auto-tuning and PID capabilities, and offer a host of available options, including user selectable inputs, outputs and ranges.

PID Control is a feature of Watson McDaniel TR890 & Nanodac Electronic Controllers. PID combines the proportional, integral and derivative functions into a single unit.

- **Proportional (P)** — Proportional control reacts to the size of the deviation from set point when sending a corrective signal. The size of the corrective signal can be adjusted in relation to the size of the error by changing the width of the proportional band. A narrow proportional band will cause a large corrective action in relation to a given amount of error, while a wider proportional band will cause smaller corrective action in relation to the same amount of error.
- **Integral (I)** — Integral control reacts to the length of time that the deviation from set point exists when sending a corrective signal. The longer the error exists, the greater the corrective signal.
- **Derivative (D)** — Derivative control reacts to the speed in which the deviation is changing. The corrective signal will be proportional to the rate of change within the process.

Auto-Tuning will automatically select the optimum values for **P**, **I** and **D**, thus eliminating the need for the user to calculate and program these values at system startup. This feature can be overridden when so desired. On some models, the control element can be manually operated.

Introduction

Design and Operation of an Electronic PID Controller

Selecting an Electronic PID Controller

When selecting a PID controller, the following parameters must be specified. (Refer to the TR890 Series Electronic PID Controller Specifications and Model Coding chart on the following two pages.)

1) Model (Case Size)

The Case Size selection is determined by both available and designed space, and controller features. Watson McDaniel Electronic Controllers are available in the following panel sizes:

TR891: 48 x 48 mm (1/16 DIN)	TR893: 96 x 96 mm (1/4 DIN)	NANODAC: 96 x 96mm (1/4 DIN)
TR892: 72 x 72 mm	TR894: 96 (H) x 48 (W) mm (1/8 DIN)	

2) Input

The Input is the measurement signal received by the controller from the sensor. One of the following three input types can be specified for the controller: 8: Universal, 4: Current or 6: Voltage. The Universal input type is switchable between Thermocouple, RTD and mV input signals.

If temperature will be measured with a thermocouple or RTD sensor, the Universal input type must be selected for the controller (Model Code Position 2 = 8). If another process variable such as PRESSURE is being measured, verify the type of output signal from that sensor. If it's 4-20 mA or 0-10 Volts then the Current or Voltage input option would be chosen, respectively.

3) Control Output

The Control Output is the corrective signal transmitted from the controller to the control device. One of the following four control output types can be specified for the controller: I: 4-20 mA DC, Y: On/Off Contact, P: Solid State Relay (SSR) Driver or V: 0-10 VDC.

The most common control devices are the TA901 Electro-pneumatic (I/P) Transducer and CE100-Series Valve Positioner with built-in I/P transducer, both of which accept a 4-20 mA signal. For these devices, the 4-20 mA control output type must be selected for the controller (Model Code Position 3 = I). The TA901 or CE1 00-Series output an air signal to the actuator of the Control Valve, which is the final control element of the feedback loop.

The On/Off Contact and SSR Driver control output types are typically used to switch on AC power to a load. If the SSR Driver control output is selected, an external solid state relay (SSR) is required and can be used for activating electrical equipment with larger current requirements.

4) Power Supply

The power supply requirement for the electronic controller must be specified. The available choices are: 100-240 VAC, 50/60 Hz or 24 V AC/DC, 50/60Hz.

5) Event Output (Option)

The Event Output is used to signal an external device when an alarm condition is detected. Various alarm types can be detected by the controller. These include deviation of the measured value from the set value, the measured value exceeding absolute limits (i.e., high and low level alarm) and heater break/loop alarm (i.e., heater current outside of normal limits). If selected as an option, the controller will have two Event Outputs. In the case of a high/low alarm, one output is used for the high level alarm and the other for the low level alarm.

6) Options: Analog Output & Digital Input

The Analog Output is an optional secondary signal that transmits either the measured process value (PV), the target set value (SV) or the Control Output value from the controller to a remote data acquisition device, such as a recorder, personal computer or display unit. One of the following three analog output types can be specified for the controller: 0-10 mV DC, 4-20 mA DC or 0-10 V DC. The analog output type is independent of the measured input type or the control output type. However, the analog output type selection must be compatible with the data acquisition device input.

The Digital Input is an optional input that can be specified for the controller. The digital input functions as an On/Off switch and can be programmed to activate the Set Value Bias or Standby mode, or switch the Control Action type (i.e., to Reverse Acting or Direct Acting).

Note: The Analog Output and Digital Input combination is not available for Model TR891. Only one of these options can be selected for this model.

Multiple Sizes

± 0.3% Accuracy

Keyboard Programmable

Reverse or Direct Acting

Manual Output Override

The **TR890 Series** Electronic PID Controller is designed for use on applications where large load changes are expected, or extreme accuracy and fast response times are needed. With full auto-tune capabilities and a large selection of available inputs, the TR890 Series is ideally suited for use with a Watson McDaniel Control Valve.

Use of a Watson McDaniel No. TA987 Air Filter/Regulator is recommended for filtering and regulating the pressure of plant compressed air, and for delivering clean, dry air at the proper pressure to pneumatic control devices.

Approximate Shipping Weights:

TR891: 0.4 lbs [0.17 kg]

TR892: 0.6 lbs [0.28 kg]

TR893: 0.7 lbs [0.33 kg]

TR894: 0.5 lbs [0.24 kg]

The **NANODAC Series** is a PID Controller with added features such as data recording and Modbus Communication (BACnet is optional).

Standard features include (4) universal analog inputs, (2) 4-20mA outputs, (3) mechanical 2A relays, and 100-230VAC power supply. 24VAC/DC and other options available; Consult factory.

- ▶ 3.5" TFT Color Display
- ▶ PID Control with Data Recording
- ▶ Modbus or BACnet Communication Protocol
- ▶ 4 High-Accuracy Inputs
- ▶ Compact 1/4 DIN Panel Mount

Specifications

Panel mounting	1/4 DIN
Weight:	Instrument Only: 0.97 lbs (0.44 kg)
Panel cutout dimension:	92 mm x 92 mm (both -0.0 +0.08 in) or 3.62 in x 3.62 in (both -0.0 +0.03 in)
Depth behind panel:	90 mm (3.54) excluding wiring

- ▶ Intrinsically Safe
- ▶ Zero and Span Adjustments

The **TA901 Electropneumatic (I/P) Transducer** converts a milliamp current signal to a linearly proportional pneumatic output pressure. This transducer is designed for control applications that require a high degree of reliability and repeatability. The TA901 is used in the control operation of valve actuators and pneumatic valve positioners in the petrochemical, HVAC, energy management, textile, paper, and food & drug industries.

The TA901 I/P Transducer is tested and approved by Factory Mutual as Intrinsically Safe Class I, II and III, Division I, Groups C, D, E, F and G when installed in accordance with the Installation, Operation and Maintenance Instructions. It should be installed in a vertical position in a vibration-free area.

The Watson McDaniel TA987 Air Filter/Regulator is recommended for filtering and regulating the pressure of plant compressed air, and for delivering clean, dry air at the proper pressure to pneumatic control devices.

Specifications

How to Order

Order using Item Number: **TA901**

Unit: inches [mm].

- ▶ **Cast Aluminum Housing**
- ▶ **Removable Nylon Mesh Filter**
- ▶ **Low Air Consumption**
- ▶ **Drip Well**

The **TA987 Air Filter/Regulator** is recommended for filtering and regulating the pressure of plant compressed air, and for delivering clean, dry air at the proper pressure to pneumatic control devices. Supply air enters the inlet port, passes through the filtering element, and exits through the reducing valve to the outlet port. The filtering element removes particles as small as 5 microns. A drip well is provided for the accumulation of oil and water and a drain cock is included to allow purging of the unit. The filtering element is readily accessible for cleaning by removal of the drip well bowl.

The maximum allowable supply pressure to TA987 Air Filter/Regulator is 250 PSIG. Improper application may cause failure of the regulator, resulting in possible personal injury or property damage.

Steel Head

Weather-Proof

Welded or
Spring Loaded
Stem

SEAL-WELDED or
SPRING-LOADED

The Watson McDaniel **Connection Head** is available with both Type J and Type K Thermocouples, as well as RTD sensors. The weatherproof head provides a conduit connection and is available in cast aluminum (screw cover), polypropylene (flip cover) and stainless steel (screw cover). The stem is either welded directly to the 1/2" NPT threaded connection, or is spring-loaded to provide maximum sensitivity. The spring-loaded stem must always be installed in a thermowell.

Extension wire and transmitter accessories are also available. Please consult factory.

For applications where the process media may be corrosive or contained under pressure, the use of a thermowell is required to prevent damage to the sensor and facilitate its removal from the process. To prevent leakage of the process media, spring loaded sensors must always be installed in a thermowell.

Other Lengths: Specify in inches (24" maximum)

A **Thermowell** is a pressure tight receptacle designed to accept a temperature sensing element and provide a means to insert that element into a vessel or pipe. It acts as a barrier between a process medium and the sensing element of a temperature measuring device and protects against corrosive process media. A thermowell also allows the sensing element to be removed from the application while maintaining a closed system. The material chosen must be compatible with the process medium to which it is exposed.

The U-length (insertion length) of a thermowell indicates its insertion depth into a process vessel or piping system and is measured from the tip of the thermowell to the underside of the threads. Lagging extension thermowells are used on applications where insulation covers the vessel or piping system. The extension length (T-length) is the measurement between the instrument connection and process connection of the thermowell.

Universal Style Quick-Change Liquid Drainers available; Consult factory.

Float Type Liquid Drainer

Why use Liquid Drainers?

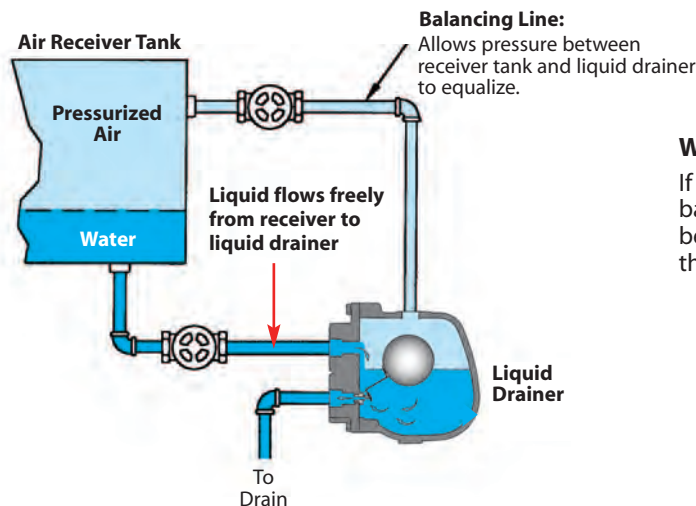

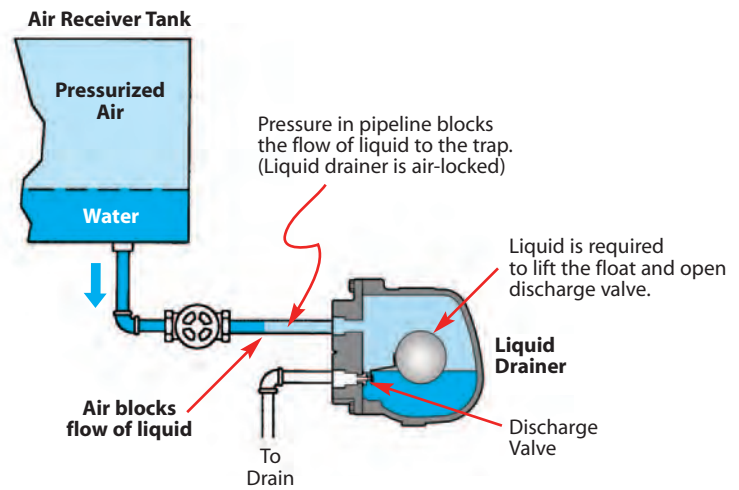

Liquid Drain Traps are primarily used to remove condensation from tanks or pipes containing air or other pressurized gases. The proper liquid drain trap should be selected based on pressure limitation, volume of liquid to be drained and material compatibility.

When are Balancing Lines required?

If a Float Type Liquid Drain Trap is selected, it may be required to add a balancing (or equalizing) line to allow any air or gases trapped in the drainer to escape. If the balancing line is not installed, these gases can prevent proper operation by air-binding the trap. Inverted Bucket Type and Disc Type Drain Traps will self-vent, eliminating the risk of air-binding and therefore do not require balancing lines.

Without a Balancing Line

In applications where the volume of liquid being drained is large enough to fill the complete diameter of the pipe, the potential for air binding exists. This is occurs because Float type drain traps are normally closed, with the weight of the float keeping the valve in the closed position. Liquid must first enter the body of the trap to lift the float and open the valve. When the liquid tries to flow down the pipe, the air pressure inside the trap will continue to build and stop the flow of liquid causing the trap to air bind. A balancing line will equalize the pressure allowing the liquid to freely enter the trap and lift the float, allowing proper discharge to take place.

With a Balancing Line

If a Float Type Liquid Drainer is used on a receiver or tank, a balancing line is normally required. The balancing line must be installed above the highest liquid level point to ensure that condensate does not block the balancing line.

Some Examples of Liquid Drainer Applications

Figure 1 Draining Condensate from Air Line with a Float Type Liquid Drainer

Typically, most air line applications have a low level of condensate to discharge, and the piping does not become flooded with condensate. In this type of application a Float Type Liquid Drainer can be used without the need of a balancing line. Due to the low level of liquid being drained, an air space exists above the liquid in the pipe which balances the pressure allowing liquid to flow freely.

Figure 2 Draining Condensate from a Separator on a Large Air Main

When large loads of condensate are required to be discharged, make sure a properly sized liquid drain trap is used. On large load applications, a balancing line is required, because non-condensable gases can be easily trapped in the drain trap due to fluctuating condensate levels.

Figure 3 Draining Condensate from a Receiver with an Inverted Bucket Style Liquid Drainer

In an application where an Inverted Bucket Liquid Drainer is used, a balancing line may not be required. This style of drainer has a small internal bleed hole on the bucket float which allows a small amount of air to be vented. For the Inverted Bucket Liquid Drain Trap to operate, it must be primed with liquid prior to operation.

Figure 4 Draining Condensate from Drip Leg with a Guided Float Type Liquid Drainer
All Stainless Steel

Guided Float Type Liquid Drainers

The Guided Float Type Liquid Drainers are available in either repairable or non-repairable configurations. All Stainless Steel body and internal components are suitable for corrosive applications. In low-flow drip applications, a balancing line is normally not required.

Typical Applications

The **WLD1900 Series** is used in applications where immediate and continuous discharge of liquid is required. Typically used in process applications for draining condensate from air or other gases.

How It Works

The WLD1900 Series liquid drainers contain a float-operated valve. When liquid enters the drainer, the float rises opening the valve which allows liquid to be drained.

Features

- All stainless steel internals
- Hardened valve seat for longer service life
- Cast Iron body
- In-line repairable

Sample Specification

The liquid drain trap shall be float operated with a cast iron body, all stainless steel internals and a hardened valve seat. The unit shall be in-line repairable and equipped with a FNPT threaded connection for the use of a balance line.

Installation

The installation should include isolation valves to facilitate maintenance and an in-line strainer. The trap must be level and upright for the float mechanism to operate. Trap must be adequately sized and properly located in the system. Installation may require an equalizing or balancing line connected from top of drainer body to the above piping, for proper drainage.

Maintenance

All working components can be replaced with the drain trap remaining in the pipeline. Repair kits include float, valve seat & disc, and gaskets. For full maintenance details see Installation and Maintenance Manual.

How to Size / Order

Determine the capacity (lbs/hr) required at the specified differential pressure. Locate differential pressure on capacity chart; move down column to capacity required. Make sure to select the correct model based on the maximum inlet pressure.

Example:

Required to drain 3,000 lbs/hr at a differential pressure of 5 PSI. The maximum inlet pressure is 30 PSIG.

Select Model: **WLD1916-030**, 1½", capacity up to 4,710 lbs/hr based on 5 PSI differential pressure.

Capacity in lbs/hr is based on differential pressure across the drainer. Select a model with an equal or higher PMO (max. operating pressure) than the maximum inlet pressure to the drainer. If the pressure to the drainer exceeds the PMO, the drainer may not open. If discharging to atmosphere, the differential pressure is equal to the inlet pressure.

CAPACITIES – Cold Water (lbs/hr)

*PMO based on a liquid with a specific gravity of 1.0. Consult factory for the PMO of a liquid specific gravity less than 1.0.

Liquid Drainers

Float Type Liquid Drainer

WLD1400/WLDS1400 Series

Float Type

Model	WLD1400	WLDS1400
Sizes	1/2" - 2"	1/2" - 1"
Connections	NPT, 150# FLG (1" - 2")	NPT, SW 150#/300# FLG
Body Material	Ductile Iron	316 Stainless Steel
PMO Max. Operating Pressure	300 PSIG	225 PSIG
TMO Max. Operating Temperature	450°F	
PMA Max. Allowable Pressure	300 PSIG up to 450°F	
TMA Max. Allowable Temperature	450°F @ 300 PSIG	

WLD140: 1/2" & 3/4" available in NPT only.

WLDS1400: Available in 1/2" - 1" only;
Capacities same as 1/2" - 3/4" WLD1400.

Typical Applications

The **WLD1400 & WLDS1400 Series** is used on air and gas applications as drip traps on piping runs as well as drainage for systems and various process vessels that have moderate condensate loads.

How It Works

The **WLD1400 & WLDS1400 Series** liquid drainers contain a float-operated valve. When liquid enters the drainer, the float rises opening the valve which allows liquid to be drained.

Features

- All stainless steel internals
- Hardened valve seat for longer service life
- Ductile Iron or Stainless Steel body
- In-line repairable

Options

- Drain connection - WLD1400: 1"-2"; WLDS1400: all sizes
- WLDS1400 only - Left, Right, or Vertical (downward) flow direction

MATERIALS

Body & Cover WLD1400	Ductile Iron
Body & Cover WLDS1400	CF8M Stainless Steel
Gasket	Garlock 3400
Cover Screws	Stainless Steel, Gr 5
Float	Stainless Steel, AISI 304
Internals	Stainless Steel, 300 Series
Valve Seat	Stainless Steel, 17-4 PH
Valve Disc	Stainless Steel, AISI 420F

Sample Specification

The liquid drain trap shall be float operated with a ductile iron or stainless steel body, all stainless steel internals and a hardened valve seat. The unit shall be in-line repairable and equipped with a FNPT threaded connection for the use of a balance line.

Installation

The installation should include isolation valves to facilitate maintenance and an in-line strainer. The trap must be level and upright for the float mechanism to operate. Trap must be adequately sized and properly located in the system. Installation may require an equalizing or balancing line connected from top of drainer body to the above piping, for proper drainage.

Maintenance

All working components can be replaced with the drain trap remaining in the pipeline. Repair kits include float, valve seat & disc, and gaskets. For full maintenance details see Installation and Maintenance Manual.

2"	11.9	4.3	9.6	1.4	12	40

Note: For flanged dimensions, refer to FTT and FTTS Steam Trap pages.

How to Size / Order

Determine the capacity (lbs/hr) required at the specified differential pressure. Locate differential pressure on capacity chart; move down column to capacity required. Make sure to select the correct model based on the maximum inlet pressure.

Example:

Required to drain 3,500 lbs/hr at a differential pressure of 2 PSI. The maximum inlet pressure is 15 PSIG.

Select Model: **WLD1416-N-065**, 1 1/2", capacity up to 4,300 lbs/hr based on 2 PSI differential pressure. PMO = 65 PSI

Capacity in lbs/hr is based on differential pressure across the drainer. Select a model with an equal or higher PMO (max. operating pressure) than the maximum inlet pressure to the drainer. If the pressure to the drainer exceeds the PMO, the drainer may not open. If discharging to atmosphere, the differential pressure is equal to the inlet pressure.

Note: WLDE and WLDES available with optional sight glass; Consult factory.

Typical Applications

The **WLDE/WLDES Series** high-capacity condensate drainers meet the flow requirements that are typically found in heavy industrial process applications for air and other gases.

How It Works

The WLDE/WLDES Series liquid drainers contain a float-operated valve. When liquid enters the drainer, the float rises opening the valve which allows liquid to be drained.

Features

- Ductile Iron or Cast Steel body and cover
- All stainless steel internals for long service life
- High capacity liquid removal
- Rugged construction design for heavy industrial use
- In-line repairable

Sample Specification

The liquid drain trap shall be float operated with a ductile iron or cast steel body and all stainless steel internals. The unit shall be in-line repairable and equipped with a FNPT threaded connection for the use of a balance line.

Installation

The installation should include isolation valves to facilitate maintenance and an in-line strainer. The trap must be level and upright for the float mechanism to operate. Trap must be adequately sized and properly located in the system. Installation may require an equalizing or balancing line connected from top of drainer body to the above piping, for proper drainage.

Maintenance

All working components can be replaced with the drain trap remaining in the pipeline. Repair kits include float, valve seat & disc and gaskets. For full maintenance details see Installation and Maintenance Manual.

How to Size / Order

Determine the capacity (lbs/hr) required at the specified differential pressure. Locate differential pressure on capacity chart; move down column to capacity required. Make sure to select the correct model based on the maximum inlet pressure.

Example:

Required to drain 80,000 lbs/hr at a differential pressure of 5 PSI. The maximum inlet pressure is 100 PSIG.

Select Model: **WLDE-125-18-N**, 2 1/2", capacity up to 87,294 lbs/hr based on 5 PSI differential pressure. PMO = 125 PSI

Capacity in lbs/hr is based on differential pressure across the drainer. Select a model with an equal or higher PMO (max. operating pressure) than the maximum inlet pressure to the drainer. If the pressure to the drainer exceeds the PMO, the drainer may not open. If discharging to atmosphere, the differential pressure is equal to the inlet pressure.

CAPACITIES – Cold Water (lbs/hr)

* PMO based on a liquid with a specific gravity of 1.0. Consult factory for the PMO of a liquid with specific gravity less than 1.0.

Liquid Drainers

Float Type Liquid Drainer

WLD600 • Carbon Steel
WLD601 • 316 SS

Model	WLD600 & WLD601
Sizes	3/4", 1", 1 1/2", 2", 3", 4"
Connections	NPT, SW, Flanged
Body Material WLD600	Carbon Steel
Body Material WLD601	316 Stainless Steel
PMO Max. Operating Pressure	450 PSIG
TMO Max. Operating Temperature	750°F
PMA Max. Allowable Pressure	* 990 PSIG @ 100°F
TMA Max. Allowable Temperature	* 750°F @ 670 PSIG

* 3/4" - 2" only.

Note: For dimensions and capacities of 3" & 4" liquid drain traps, refer to model FT600 in the Steam Trap section.

Typical Applications

The **WLD600/WLD601 Series** are used in applications where immediate and continuous discharge of large amounts of liquid is required. Typically used in heavy industrial process applications for draining condensate from air or other gases.

How It Works

The WLD600/WLD601 Series liquid drainers contain a float-operated valve. When liquid enters the drainer, the float rises opening the valve which allows liquid to be drained.

Features

- All stainless steel internals for long service life
- Body & cover available in Carbon Steel or 316 SS
- Rugged construction designed for heavy industrial applications
- In-line repairable

Sample Specification

The liquid drain trap shall be float operated with a cast steel body (or stainless steel body for WLD601) and all stainless steel internals. The unit shall be in-line repairable and equipped with a FNPT threaded connection for the use of a balance line.

Installation

The installation should include isolation valves to facilitate maintenance and an in-line strainer. The trap must be level and upright for the float mechanism to operate. Trap must be adequately sized and properly located in the system. Installation may require an equalizing or balancing line connected from top of drainer body to the above piping, for proper drainage.

Maintenance

All working components can be replaced with the drain trap remaining in the pipeline. Repair kits include float, valve seat & disc and gaskets. For full maintenance details see Installation and Maintenance Manual.

Options

316 SS Body & Cover: use Model WLD601.

MATERIALS

Body & Cover WLD600	Cast Steel, ASTM A-216 WCB
Body & Cover WLD601	Cast 316 SS
Cover Studs	Steel, SA 193, Gr B7
Cover Nuts	Steel, SA 194, Gr 2H
Cover Gasket	Stainless Steel Reinforced Grafoil
Valve Assembly	Stainless Steel, AISI 431
Gasket, Valve Assembly	Stainless Steel Reinforced Grafoil
Pivot Assembly	Stainless Steel, 17-4 PH
Mounting Screws	Stainless Steel Hex Head, 18-8
Float	Stainless Steel, ASTM 240 TY 304

How to Size / Order

Determine the capacity (lbs/hr) required at the specified differential pressure. Locate differential pressure on capacity chart; move down column to capacity required. Make sure to select the correct model based on the maximum inlet pressure.

Example:

Required to drain 2,000 lbs/hr at a differential pressure of 300 PSI. The maximum inlet pressure is 325 PSIG.

Select Model: **WLD600-450-14-N**, 1" NPT, capacity up to 2,250 lbs/hr based on 300 PSI differential pressure

Connections: (N=NPT, SW=Socket Weld, F150=150# FLG, F300=300# FLG, F600=600# FLG)

Example Models: **WLD600-450-14-SW** = 1" Socket Weld
WLD600-450-14-F600 = 1" 600# FLG

Liquid Drainers

Float Type Liquid Drainer

WLD600 • Carbon Steel
WLD601 • 316 SS

DIMENSIONS & WEIGHTS – inches/pounds										Weight (lbs)	
Size	A	AA	B	C	D	E	F	G *		NPT/SW	FLG
3/4"	6 1/8	10 1/8	2 1/8	3 7/16	7 7/16	8 7/16	5 13/16	3/8		25	31
1"	6 1/2	10 7/16	2 1/2	5 1/2	8 7/16	9 1/2	6 5/16	3/8		31	36
1 1/2"	9 13/16	14	3 7/16	9	10 7/16	11 15/16	7 13/16	1/2		82	91
2"	11 13/16	16	3 1/8	7 7/16	11 1/8	13 5/16	6 13/16	1/2		93	107

* Balancing Port available with 1/2" flanged connection. Specify on order.

Capacity in lbs/hr is based on differential pressure across the drainer. Select a model with an equal or higher PMO (max. operating pressure) than the maximum inlet pressure to the drainer. If the pressure to the drainer exceeds the PMO, the drainer may not open. If discharging to atmosphere, the differential pressure is equal to the inlet pressure.

WLD1800R
(Repairable)

Typical Applications

The **WLD1800/1800R Series** are used on industrial air and gas applications for drainage of liquid from systems.

How It Works

The WLD1800 Series liquid drainers contain a float-operated valve. When liquid enters the drainer, the float rises opening the valve which allows liquid to be drained.

Features

- **Stainless steel body**
- **All stainless steel internals for longer service life**
- **Guided float ensures proper valve seating on every cycle**
- **Repairable unit available (WLD1800R)**

Sample Specification

The liquid drain trap shall have a guided-float operation with a tamper-proof seal-welded stainless steel body and all stainless steel internals. The unit shall be available with an in-line repairable version. All units to be equipped with FNPT threaded end connections.

Installation

The installation should include an in-line strainer. The trap must be level and upright for the float mechanism to operate. Trap must be adequately sized and properly located in the system.

Maintenance

The WLD1800 is non-repairable. The WLD1800R is fully repairable and all working components can be replaced. Repair kits include float, lever & seat assembly, and gaskets. For full maintenance details see Installation and Maintenance Manual.

MATERIALS

(Repairable)

How to Size / Order

Determine the capacity (lbs/hr) required at the specified differential pressure. Locate differential pressure on capacity chart; move down column to capacity required. Make sure to select the correct model based on the maximum inlet pressure.

Example: Required to drain 1,000 lbs/hr at a differential pressure of 200 PSI. The maximum inlet pressure is 250 PSIG.

Select Model: **WLD1822-N** 3/4" x 3/4" (non-repairable) or **WLD1822R-N** 3/4" x 3/4" (repairable); capacity up to 1,200 lbs/hr based on 200 PSI differential pressure.

PMO Max. Operating Pressure	200 PSIG
TMO Max. Operating Temperature	450°F
PMA Max. Allowable Pressure	250 PSIG up to 450°F
TMA Max. Allowable Temperature	450°F @ 250 PSIG

WLD1521/1522/1524
with Strainer

Typical Applications

The **WLD1500 Series** Inverted Bucket Liquid Drain Traps are recommended for the removal of liquids from compressed air systems. A scrubber wire is used to keep bleed hole on top of inverted bucket from clogging due to oil that may be present in the water being drained. Oil mixed with water is typically found on compressed air systems.

How It Works

When there is condensate in the system, the inverted bucket inside the liquid drain trap rests on the bottom due to its weight; with the valve in the open position. This allows liquid entering the trap to be discharged through the seat orifice located at the top. When air enters the trap, the bucket floats to the surface and closes off the discharge valve, containing the air in the system. Eventually, air is bled off through a small hole in the top of the bucket and the bucket sinks; repeating the cycle.

Features

- Hardened stainless steel valves and seat
- Only two moving parts
- Scrubber wire in air vent of bucket
- Discharge orifice at top of trap reduces potential for clogging
- In-line repairable

Sample Specification

Drain trap shall be an inverted bucket trap design with cast iron body, all stainless steel internals, hardened valve & seat, plus a scrubber wire. The unit shall be in-line repairable.

Installation

Installation should include isolation valves for maintenance purposes. Trap must be installed in upright position to function properly. It may be necessary to prime the bucket trap by filling it with water through the priming port prior to startup.

Maintenance

Close isolation valves prior to any maintenance. All working components can be replaced with the drain trap remaining in the pipeline. Repair kits include lever & seat assembly, strainer screen and gaskets. For full maintenance details see Installation and Maintenance Manual.

WLD1524-14-N	1"	7	12 ⁷ / ₁₆	7 ¹³ / ₁₆	7 ⁷ / ₁₆	30

How to Size / Order

Determine the capacity (lbs/hr) required at the specified differential pressure. Locate differential pressure on capacity chart; move down column to capacity required. Make sure to select the correct model based on the maximum inlet pressure.

Example:

Required to drain 200 lbs/hr at a differential pressure of 5 PSI. The maximum inlet pressure is 30 PSIG.

Select Model: **WLD1521-13-N**, 3/4" NPT, with strainer, capacity up to 220 lbs/hr based on 5 PSI differential pressure.

Capacity in lbs/hr is based on differential pressure across the drainer. Select a model with an equal or higher PMO (max. operating pressure) than the maximum inlet pressure to the drainer. If the pressure to the drainer exceeds the PMO, the drainer may not open. If discharging to atmosphere, the differential pressure is equal to the inlet pressure.

CAPACITIES – Cold Water (lbs/hr)

* PMO based on a liquid with a specific gravity of 1.0. Consult factory for the PMO of a liquid with specific gravity less than 1.0.

Liquid Drainers

Disc Type Liquid Drainer

WLD1703S Series

Disc Type

Model	WLD1703S
Sizes	1/2"
Connections	NPT
Body Material	Stainless Steel
Options	Blowdown Valve
PMO Max. Operating Pressure	250 PSIG
TMO Max. Operating Temperature	750°F
PMA Max. Allowable Pressure	915 PSIG up to 250°F
TMA Max. Allowable Temperature	610°F @ 750 PSIG

Typical Applications

The **WLD1703S** is used on air and gas applications as drip traps on system mains and other piping runs. These drain traps are ideal for outdoor applications where units are subject to freezing.

How It Works

The disc type liquid drain trap has a cyclic on/off operation with a disc that is pushed open when condensate is present and pulled closed when air or gas tries to escape.

Features

- Rugged, stainless steel body and hardened seat
- Handles a wide range of pressures up to 250 PSIG
- Works in any position (horizontal preferable)
- Integral strainer with blowdown option
- Three-holed balanced discharge
- Freeze-proof in vertical flow-down position

Sample Specification

Drain Trap shall be a Disc Type with an all stainless steel construction. Body shall have a built-in strainer with optional blowdown valve. Integral seat design and disc to be hardened for long service life. Unit shall be capable of installation in any orientation and self-draining when mounted vertically with flow direction downwards.

Installation

Drain Trap can be installed in any position; however, horizontal is preferred. Installation should include isolation valves for maintenance purposes.

WLD1703SB
with Strainer &
Blowdown
Valve

Units: inches

Maintenance

Dirt is the most common cause of premature failure. The strainer may require periodic cleaning. For full maintenance details see Installation and Maintenance Manual.

Options

Blowdown valve allows strainer to be cleaned without removal.

MATERIALS

Body	Stainless Steel, AISI 420F
Disc	Stainless Steel, AISI 420
Cap	Stainless Steel, AISI 416
Strainer Screen	Stainless Steel, AISI 304
Blowdown Valve*	Stainless Steel, AISI 303

* WLD1703SB model only.

CAPACITIES – Cold Water (lbs/hr)

Model Code	Description	Pipe Size	2	5	10	25	50	80	100	125	150	180	200	250
WLD1703S-12-N	Strainer	1/2"												
WLD1703SB-12-N	Strainer & Blowdown		90	130	190	300	425	530	600	670	715	790	835	955

Note: 1) Maximum back pressure not to exceed 80% of inlet pressure.

2) To determine gallons per minute of flow, divide values in chart by 500. Example: 600 lbs/hr = 600 ÷ 500 = 1.2 GPM

Pipeline Accessories

STAINLESS STEEL CHECK VALVES

Watson McDaniel Check Valves are available in all 316 SS construction in 1/2" thru 3" sizes and are specifically designed to handle the difficult environments associated with steam and hot condensate service. Check valves can be installed on the discharge side of steam traps to eliminate backflow into the trap. With the specially designed 1/4 PSI low cracking pressure spring, these check valves come standard on all Watson McDaniel Pressure Motive Pumps.

Y-STRAINERS

Strainers remove dirt and pipe scale from steam systems to protect critical components such as Regulators, Pumps and Steam Traps from damage. Available in Cast Iron, Carbon Steel and Stainless Steel up to 4" in size.

SUCTION/MIXING TEES

This is a unique and specialized product used for blending, mixing, aeration or heating by mixing steam and water together. Available in Cast Iron, Bronze and Stainless Steel.

DRIP PAN ELBOWS

Drip Pan Elbows are used to collect and remove condensate. Typically used with steam safety relief valves.

PIPELINE ACCESSORIES

FLASH TANKS

Flash tanks are installed in condensate return systems to vent flash steam and neutralize pressure in condensate return lines. The flash steam may be used for low pressure heating applications or vented to atmosphere.

EJECTORS

Ejectors are used for non-electric pumping of fluids or evacuating a tank or vessel of air or other gases. Used on sterilizing equipment for pre and post-evacuation of the chamber.

AIR ELIMINATORS

Air Eliminators are used on tanks or piping systems to vent air without allowing the liquid inside the tank or piping to escape. Available in Cast Iron and Stainless Steel.

SAFETY RELIEF VALVES

Watson McDaniel Safety Relief Valves are ASME qualified for steam service and are available in Bronze and Cast Iron in 1/2" thru 6" sizes.

STEAM TRAP TEST VALVES

Test Valves can be installed downstream of any steam trap to visually inspect the discharge of condensate from the traps. Available in Stainless Steel up to 1" in size.

EXHAUST HEADS

Exhaust Heads are used to separate entrained water from steam that is being vented directly into the atmosphere, preventing damage to rooftops and other equipment from hot water.

VACUUM BREAKERS

Vacuum Breakers "break the vacuum" caused by the condensing of steam or draining of liquid. These are primarily installed on the top of heat exchangers, allowing condensate to properly drain from the system.

FREEZE & SCALD PROTECTION VALVES

Freeze Protection Valves automatically open and discharge liquid to protect equipment from freeze damage. Scald Protection Valves automatically open and discharge overheated liquid from a system to protect personnel from possible injury due to scalding.

STEAM HUMIDIFIERS

Steam Humidifiers control humidity in commercial offices, hospitals, warehouses and various types of industrial facilities.

THERMOSTATIC AIR VENTS

Air Vents purge unwanted air from steam systems which can inhibit the steam from entering process equipment, vessels and piping. Air vents should be placed at all high points in the piping system and on heat transfer equipment.

AIR/STEAM MOISTURE SEPARATORS

Separators are used for the removal of entrained moisture in steam and compressed air lines. Separators should be placed before all regulating valves to eliminate problems caused by water logging and wire drawing of the valve seats.

AIR/STEAM MOISTURE SEPARATORS

Separators are used for the removal of entrained water from steam or air.

CHECK VALVES

The WSSCV is an all stainless steel in-line check valve for steam, gas or liquid service. Used in the petrochemical, pulp & paper, textile and food & beverage industries.

STRAINERS

Strainers are used to remove dirt particles from fluid or steam and provide inexpensive protection for critical equipment such as pumps, meters, valves, traps and turbines.

DRIP PAN ELBOW

Drip Pan Elbows are used to collect and remove condensate. Typically used on steam boilers and safety valves.

SAFETY RELIEF VALVES

Safety Relief Valves are used for over-pressure protection on steam systems.

Application & Usages

Air Vents & Vacuum Breakers

AIR VENTS (AV2000)

Air vents are used in steam systems for the removal of air and other non-condensable gases from process equipment, vessels and piping. Place at end of steam main and directly on process equipment.

VACUUM BREAKER (WVBSS)

Vacuum breakers allow air to enter a system in order to "break the vacuum."

In a heat exchanger, the vacuum is caused by condensing steam which inhibits condensate drainage.

Drainage of liquids from storage tanks will also cause an undesirable vacuum which inhibits flow or can possibly collapse tank or vessel.

Flash Tanks & Exhaust Heads

EXHAUST HEADS

Exhaust Heads separate entrained water from steam prior to being discharged directly to the atmosphere. Eliminates damage to rooftops and other equipment caused by hot condensate.

FLASH TANKS

Flash tanks are installed in condensate return systems to vent flash steam and neutralize pressure in condensate return lines. The flash steam may be vented to atmosphere or used for low pressure heating applications.

Steam Trap Test Valve

STEAM TRAP TEST VALVE

The **WSTTV** Steam Trap Test Valve offers simple, immediate and visible diagnosis of any steam trap. Turning the handle 90° to the "Test" position will direct flow of steam trap out the test port for visual evaluation of discharge. This is the most effective method to inspect the function of a steam trap.

Air Eliminators

Application & Usages

Suction & Mixing Tees

Controlling temperature of large open tank by steam injection

Suction Tees promote the mixing of steam and water. When steam flows through the suction tee, a slight vacuum is created which pulls water through the secondary inlet.

Aeration or Agitation

Liquid pumped through the Suction Tee produces suction, which pulls in air through the secondary inlet.

SUCTION OR MIXING TEE

The Watson McDaniel Cast Iron, Bronze or Stainless Steel **Suction Tee** is a specialized type of pipe fitting used for blending, agitation, recirculation, mixing, aeration and heating.

Ejector (Pumping Liquid)

EJECTORS

Watson McDaniel **Ejectors** perform a variety of functions depending upon the application and motive fluid (steam or water) used. See performance charts on the following pages. Applications include: exhausting, agitating, aerating, circulating, pumping and mixing.

When liquid or steam flows thru the primary inlet, a vacuum is created which causes water to be pulled through the secondary inlet. The maximum height that water or any liquid with a specific gravity of 1 can be lifted is 25 feet. Increases in the temperature of the liquid being lifted will cause this maximum height to decrease.

Stainless Steel

Model	WSSCV
Sizes	1/2", 3/4", 1", 1 1/4", 1 1/2", 2", 3"
Connections	NPT, SW
Body Material	316 Stainless Steel
PMO Max. Operating Pressure	500 PSIG
PMA Max. Allowable Pressure	750 PSIG @ 100°F
TMA Max. Allowable Temperature	850°F @ 420 PSIG

Note: WSSCV with 1/4 PSI cracking pressure is required for all mechanical pump applications. The 5 PSIG cracking pressure version is also available. See model code chart.

Typical Applications

The Model **WSSCV** is an all stainless steel in-line check valve for steam, gas, or liquid service. It provides tight shut-off, minimizes water hammer and also stops recycling of pumps by preventing back flow of liquid. Used in the petrochemical, pulp & paper, textile and food & beverage industries. The WSSCV all stainless steel check valves will operate much longer and are less problematic than bronze or cast iron check valves.

Features & Options

- 316 Stainless Steel Body and Internals
- Low cracking pressure on spring (1/4 PSI) to minimize resistance and maximize flow.
- Available with optional 5 PSI cracking pressure (must specify at time of order)
- Available with NPT, SW, or optional Flanged connections
- Spring made from Inconel-X-750 to handle extreme temperature as well as corrosive applications
- Body is seam-welded to eliminate O-rings or gasket seals which can be affected by high temperature steam or hot condensate
- Spring assisted closing of check valve to minimize noise and wear

Sample Specification

Check valve shall have a 316 stainless steel body and disc. Spring shall be made from Inconel-X-750. Check valve body to be seam welded together to eliminate need for O-ring or gasket.

WSSCV Check Valve Construction

"UV" Steam-ASME Section VIII Pressure Vessels

Model	SVB
Sizes	1/2", 3/4", 1", 1 1/4", 1 1/2", 2", 2 1/2"
Connections	NPT
Body Material	Bronze
PMO Max. Operating Pressure	250 PSIG (steam)
TMO Max. Operating Temperature	406 °F

Typical Applications

The **SVB** Safety Valves are used for over-pressure protection on unfired pressure vessels in saturated steam systems. Valves are 100% factory tested and made in the USA.

How It Works

In the event steam pressure increases to the set point, the safety valve will "pop open" discharging steam faster than it can be produced; allowing system pressure to return to safe levels at which point the valve will close.

Features

- Stainless Steel springs
- Teflon®-PFA seat resists corrosive boiler chemicals
- Two control rings for maximum performance and adjustability
- Tapped body drain allows piping of condensate away from valve to protect the internals from fouling

Sample Specification

Safety valves shall be cast bronze construction with stainless steel springs, Teflon-PFA seats and stainless steel stems. Units shall be qualified to the ASME Boiler Code, Section VIII and suitable for steam service.

MATERIALS

Body	Bronze
Guide Ring	Brass
Disc	Brass
Seat Insert	Teflon®-PFA
Stem	Stainless Steel

"UV" Steam-ASME Section VIII Pressure Vessels

Model	SVI
Sizes	1 1/2", 2", 2 1/2", 3", 4", 6"
Connections	NPT, FLG
Body Material	Cast Iron
PMO Max. Operating Pressure	250 PSIG (Steam)
TMO Max. Operating Temperature	422° F

Typical Applications

The **SVI** Safety Valves are used for over-pressure protection on unfired pressure vessels in saturated steam systems. Valves are 100% factory tested and made in the USA.

How It Works

In the event steam pressure increases to the set point, the safety valve will "pop open" discharging steam faster than it can be produced; allowing system pressure to return to safe levels at which point the valve will close.

Features

- Stainless Steel wetted trim nozzle & disc
- Metal to metal seating, lapped to optimum flatness
- Tapped body drain allows piping of condensate away from valve to protect the internals from fouling
- Two control rings assure maximum performance and adjustability

Sample Specification

Safety valves shall be high capacity design with cast iron construction featuring rust-proof stainless steel stems, springs, washers and metal-to-metal lapped seats. Units shall be qualified to the ASME Boiler Code Section VIII and suitable for steam service.

Notes: 1) Ratings are 90% of actual capacity. 2) For Set Pressures over 250 PSIG, consult factory. 3) For other sizes, consult factory.
4) ASME Section I – Steam Boilers – pounds of saturated steam per hour @ 3% or 2 PSIG accumulation (whichever is greater).
5) ASME Section VIII – Pressure Vessels – pounds of saturated steam per hour @ 10 % or 3 PSIG accumulation (whichever is greater).

Drip Pan Elbow

Cast Iron

Model	DPL
Sizes	3/4" through 8"
Connections	NPT, FLG
Body Material	Cast Iron
PMO Max. Operating Pressure	250 PSIG

DPL
Flanged

Typical Applications

The **DPL** Drip Pan Elbow is used to collect and remove condensate. Typically used with steam boilers, pressure relief valves, safety valves and steam pressure vessels and lines.

Features

- Collects discharge condensate from steam systems
- Returns condensate to safe areas
- Increases life of safety valves
- Reduces discharge piping strain
- Female NPT or Flanged connections available

Sample Specification

Drip Pan Elbow shall be made of cast iron and conform to the Power Piping Code. It shall have a pan to collect condensate in the steam riser pipe and a drain to pipe away the condensate.

HOW TO ORDER

Specify pipe size needed for application.

Note: DPL is sized to outlet connection of SRV (safety relief valve).

Carbon Steel

Model	BDS
Sizes	3/4", 1", 1 1/2", 2", 2 1/2"
Connections	150# RF
Body Material	Carbon Steel
PMO Max. Operating Pressure	150 PSIG
TMO Max. Operating Pressure	366°F
PMA Max. Allowable Pressure	150 PSIG @ 562°F

Note: Higher pressure units available; Consult factory.

Typical Applications

The **BDS Series Blowdown Separators** help maintain boiler efficiency and operation by safely disposing of blowdown water and dissolved solids when boilers are periodically blown down. Removing potentially harmful solids and scaling from the boiler reduces fouling and damage. The high pressure blowdown from the boiler is piped to the tangential inlet of the Blowdown Separator. The stainless steel strike plate and internal steel baffles direct the flow cyclonically to separate the water and solids which fall by gravity to the drain connection at the bottom. The flash steam generated from the high pressure blowdown water is quietly vented out of the top connection. An optional aftercooler package with temperature regulator is available to install off the bottom drain of the BDS. When blowdown begins the temperature regulator will open and allow cold water to temper condensate prior to discharge in municipal sewer.

How to Size / Order

Size standard 150 psig units to match BDS Inlet Size to boiler blowdown valve size. Use the Capacity Table to confirm Blowdown Condensate load is not exceeded.

See note regarding base conditions for Boiler Pressure, Blowdown Water Flow and Cooling Water temperature. Consult factory for sizing with alternate conditions.

Example: Boiler Operating Pressure: **150 PSIG**
Blowdown Valve Size: **1 1/2"**
Blowdown Condensate Load: **37,500 lbs/hr**

Actual Load does not exceed Capacity Table or 1 1/2" Inlet Connection

Therefore Choose: **16" Blowdown Separator with 1 1/2" Inlet**
Model Code: BDS-16-F150

Example Model Code with Optional Aftercooler:
BDS-16-F150-AC-20

BDS DIMENSIONS (inches)

Minimum 20 PSIG cold water pressure @ 60°F and max 150 PSIG boiler pressure

* Cooling valve included when aftercooler option is selected. Other options available, including max. quenching valve for continuous blowdown; Consult factory.

Ductile Iron, Carbon Steel & Stainless Steel

Model	EHC	EHC	EHF	EHS
Sizes	1", 1 1/2", 2", 2 1/2", 3", 4"	6", 8", 10"	2", 2 1/2", 3", 4", 5", 6", 8", 10", 12"	
Connections	NPT, 150# FLG	125# FLG	150# FLG	
Body Material	Ductile Iron	Cast Iron	Carbon Steel	Stainless Steel

Typical Applications

Exhaust Heads are used to separate entrained water from flash steam prior to being discharged or vented to the atmosphere. Typically used to eliminate water damage to rooftops and other equipment.

How It Works

Exhaust heads use the cyclonic effect where the velocity of the steam is used to generate centrifugal motion that whirls the steam and throws the entrained water to the wall of the unit where it is released to a drain below. Correct sizing of exhaust heads for steam service is important in order to assure the highest possible desiccation of the steam.

Sample Specification

Exhaust Head shall be a cyclone design for vertical venting to atmosphere. Unit shall have a vortex containment plate feature to prevent re-entrainment of liquid. Exhaust Head to be constructed in cast iron, carbon steel or stainless steel and available in FNPT and flanged connections.

Installation

Exhaust Head must be installed at the top of a vertical vent pipe. Exercise standard piping and structural practices when installing this unit. Proper drainage of the exhaust head is essential for proper operation. Pipe the drain Connection of the exhaust head to a roof gutter or down spout.

Exhaust Head Use:

Exhaust Heads are used to separate entrained water from flash steam prior to being vented to the atmosphere. Typically used to eliminate water damage to rooftops and other equipment.

* Capacity in pounds of exhaust steam per hour at atmospheric pressure of 14.7 PSIA.

Carbon Steel

Model	WFLV
Sizes	6", 8", 12", 16"
Connections	150# RF
Body Material	Carbon Steel
PMO Max. Operating Pressure	150 PSIG
TMO Max. Operating Temperature	366°F
PMA Max. Allowable Pressure	150 PSIG @ 562°F

Note: 300 PSIG unit available. Consult factory.

Typical Applications

The WFLV Flash tanks are installed in condensate return systems to separate off flash steam from hot condensate and neutralize pressure in condensate return lines. The flash steam may be used for low pressure heating applications or vented to atmosphere.

How to Size / Order

Use **Table 1** to determine amount of Flash Steam that will be generated by the hot pressurized condensate. The percentage of Flash Steam formed is found where Condensate Pressure and Flash Tank Pressure intersect.

Multiply your Condensate Load by the decimal equivalent of the Flash Steam Percent to determine the amount of Flash Steam in lbs/hr. Then, use **Figure 1** to determine Flash Tank Size required:

Example: Condensate Pressure: **100 PSIG**
Flash Tank Pressure: **20 PSIG**
Condensate Load: **8,000 lbs/hr**
% Flash Steam: **8.7%** from chart
Decimal Equivalent % Flash Steam = **.087**

.087 x 8000 = 696 lbs/hr of flash steam

Therefore Choose: 12" FLASH TANK

Note: All Watson McDaniel flash steam recovery vessels are supplied with ASME Section VIII Code Stamp.

Table 1 – PERCENT (%) FLASH STEAM

Produced when condensate is discharged to atmosphere (0 PSIG) or into a flash tank controlled at various pressures

Carbon Steel

Model	WFLH
Sizes	12", 16", 20", 24", 36"
Connections	150# RF
Body Material	Carbon Steel
PMO Max. Operating Pressure	150 PSIG
TMO Max. Operating Pressure	366°F
PMA Max. Allowable Pressure	150 PSIG @ 562°F

300 PSIG unit available.

Flash Tanks Supplied with ASME Section VIII Code Stamp.

Typical Applications

The **WFLH Horizontal Flash Steam Recovery Vessels** are installed in condensate return systems to separate flash steam from hot condensate and neutralize pressure in condensate return lines. The flash steam may be used for low pressure heating applications or vented to atmosphere. The low-profile of horizontal flash tanks make them ideal to allow gravity drainage when head space is limited and vertical tanks cannot be installed. ASME Code Stamped.

An internal drop leg is an optional outlet connection to allow discharge condensate to be drawn from the bottom of the tank where temperature will be cooler. The optional sparge pipe inlet connection is used to diffuse incoming condensate especially when used as preheating for applications such as boiler feed.

How to Size / Order

Use **Table 1** to determine amount of Flash Steam that will be generated by the hot pressurized condensate. The percentage of Flash Steam formed is found where Condensate Pressure and Flash Tank Pressure intersect.

Multiply your Condensate Load by the decimal equivalent of the Flash Steam Percent to determine the amount of Flash Steam in lbs/hr.

Then use **Figure 1** to determine Flash Tank required.

Example:

Condensate Pressure: **15 PSIG**
Flash Tank Pressure: **0 PSIG**
Condensate Load: **5,000 lbs/hr**
% Flash Steam: **3.9% from chart**

Decimal Equivalent % Flash Steam = **.039**

.039 x 5000 = 195 lbs/hr of flash steam

Therefore Choose: **12" Flash Tank WFLH-16-N**

WFLH DIMENSIONS - inches

36"	36	WFLH-22-F150	6	3	6	310

Note: All Watson McDaniel flash steam recovery vessels are supplied with ASME Section VIII Code Stamp.

Carbon Steel

Model	FA
Inlet/Outlet Sizes	1½", 2", 2½", 3", 4",
Shell End Connections	Butt Weld
Shell Material	Carbon Steel
HP Inlet Tube Material	Stainless Steel
PMO Max. Operating Pressure	150 PSIG
TMO Max. Operating Pressure	366°F
PMA Max. Allowable Pressure	150 PSIG @ 562°F

Typical Applications

The **FA Series Flash Arrestors** are installed in condensate return piping to introduce high pressure condensate discharging from steam traps into the lower pressure condensate in the return system. The integral sparge pipe is used to diffuse the incoming bi-phase flow (condensate and flash steam) from a steam trap, which mitigates water hammer that would normally occur when discharging high pressure condensate directly into the condensate return that will be at a lower pressure.

Flash arrestors can be included when designing systems with multiple condensate return pressures or installed in overstressed or flooded return lines to improve stability. Standard design is Carbon Steel Schedule 80 shell and SST HP inlet pipe. Many options available; Consult factory.

How to Size / Order

Shell inlet and outlet conditions typically sized to match condensate return pipe diameter. To confirm sizing details, consult factory with Condensate Return Pipe Diameter and Pressure, as well as Steam Trap Size, Inlet Pressure, and Condensate Load.

MATERIALS

Shell	Carbon Steel SA-105
HP Inlet Tube	Stainless Steel, Schedule 80
Pipe Reducers	Carbon Steel

DIMENSIONS & WEIGHTS

Size Code	Model Code	Inlet / Outlet Connection		Shell Diameter	HP Inlet Connection		Weight lbs

Carbon Steel

Model	VCC
Sizes	6", 8", 12", 16"
Connections	150# RF
Body Material	Carbon Steel
PMO Max. Operating Pressure	150 PSIG
TMO Max. Operating Temperature	366°F
PMA Max. Allowable Pressure	150 PSIG @ 562°F

300 PSIG unit available.

Flash Tanks Supplied with ASME Section VIII Code Stamp.

Typical Applications

The VCC Series Vertical Condensate Coolers are used to reduce condensate temperature to acceptable limits when the condensate is being discharged to drain. Cooling water, connected to the inlet of the temperature regulating valve, is used to maintain the desired condensate outlet temperature. All units are vented to atmosphere to ensure that any flash steam is properly relieved. A steam trap is included on the drain to eliminate the possibility of steam discharge.

How to Size / Order

Use the Capacity Table to determine the proper tank diameter based on the incoming Condensate Load in lbs/hr. See note regarding base conditions for Condensate and Cooling Water temperatures. Consult factory for sizing with alternate conditions.

Example: Condensate Load **8,000 lbs/hr**
 Condensate Temperature:
 Incoming: **210°F**
 Leaving: **140°F**
 Cooling Water Temperature: **60°F**

Based on 8000 lbs/hr at standard conditions

Therefore **16" Condensate Cooler**
 Choose: **Model Code:**
VCC-16-22-F150

Specify Model Code only; steam trap & valve included

Sizing based on 20 sec mix time using 60°F water to cool condensate from 210°F to 140°F.

Why Are Air Vents & Vacuum Breakers Needed?

Air Discharging on Start-Up

(Air Vent Open)

On start-up, the steam jacketed kettle is filled with air which must first be discharged by the Air Vents to allow steam to enter for heating. Float & Thermostatic steam traps contain a separate thermostatic vent; however, additional air vents should be installed on the kettle or air will be trapped. The faster air is expelled, the faster steam can enter and heating can begin.

Air Vents are installed at the end of steam mains as well as other high points in the system. Temperature sensitive Air Vent is **OPEN** when cooler air is present and **CLOSED** when hot steam enters the system.

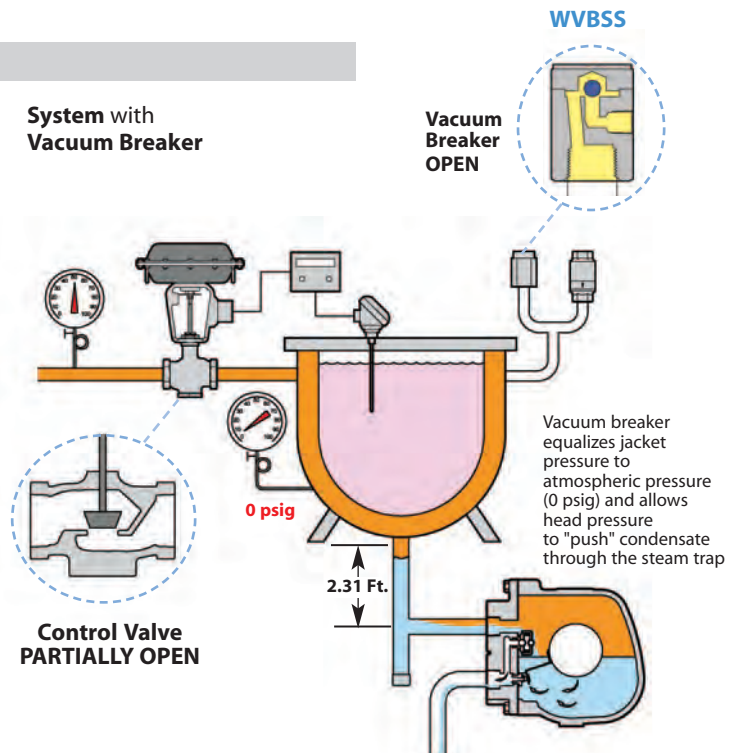

Temperature Set Point is Reached

Steam Flow is significantly Reduced after the Temperature Set Point is reached

Once the set temperature is achieved, only a small amount of steam is required to maintain the temperature of the product inside the jacketed kettle. The steam supply valve will modulate to a near shut-off condition, dropping the pressure, and the kettle will then be operating in vacuum. This action will impede the discharge of condensate as the pressure in the jacket will be less than atmospheric. Therefore, a vacuum breaker is required to allow air to enter the jacket and equalize the pressure. This then allows drainage of condensate through the steam trap by gravity. If the vertical discharge leg from the jacket is 2.31 ft., this will provide 1 psi head pressure to assist with condensate drainage.

System with Vacuum Breaker

Stainless Steel

Model Code	WVBSS-12-N
Sizes	1/2"
Connections	NPT
Body Material	Stainless Steel
PMO Max. Operating Pressure	300 PSIG
TMO Max. Operating Temperature	752°F
PMA Max. Allowable Pressure	300 PSIG up to 752°F
TMA Max. Allowable Temperature	752°F @ 300 PSIG

Typical Applications

The **WVBSS** Vacuum Breaker is used on heat exchangers, air coils, jacketed kettles, pressing machines, boiler feed water tanks, sparge systems, water lines, or anywhere else an unwanted vacuum may occur. The WVBSS allows air to enter the steam or liquid system in order to "break the vacuum" caused by the condensing of steam or draining of liquid from a system. The elimination of vacuum is necessary to allow proper drainage of liquid from process systems.

How It Works

The Vacuum Breaker functions like a simple check valve. Outside air is allowed to enter the system through the air inlet. However, when steam or water try to escape, the vacuum breaker closes off tightly.

Features

- All stainless steel construction
- Small and compact

Sample Specification

Vacuum Breaker shall be all stainless steel construction.

Installation

Unit must be installed in a vertical position and should be placed at the highest point in the system.

OPERATING SPECIFICATIONS

Vacuum required to open: 5 in. water (0.18 PSIG)

Thermostatic Air Vent

Model	AVT125
Sizes	1/2", 3/4"
Connections	NPT
Body Material	Forged Brass
PMO Max. Operating Pressure	125 PSIG
TMO Max. Operating Temperature	353°F
PMA Max. Allowable Pressure	125 PSIG up to 450°F
TMA Max. Allowable Temperature	450°F @ 125 PSIG

Air Vents are used for Removing Air from Steam Systems

Typical Applications

The **AVT125** is used on steam applications up to 125 PSIG for removal of air and non-condensable gases from process equipment, vessels and piping. The air vent should be located at a high point in the system or vessel and can be installed in any orientation.

How It Works

The thermostatic air vent contains a welded stainless steel thermal element that expands when heated and contracts when cooled. When air and non-condensable gases are present, the valve is in the open discharge position. When steam reaches the air vent, the element expands and closes the valve off tightly.

Features

- Simple design for easy maintenance
- All Stainless Steel Internals
- Thermal element is the only moving part

Sample Specification

Air vent shall have a stainless steel thermal element with forged brass construction, featuring a union nipple inlet connection. The valve and seat shall be stainless steel.

Installation & Maintenance

Air vents should be located at a high point in the system or vessel. The air vent can be installed in any orientation. An isolation valve should be installed to facilitate repair without system shut-down. Unit is in-line repairable. Repair kits are available.

Air Vents are used for Removing Air from Steam Systems

Typical Applications

The **AV2000** air vent is used on industrial steam applications up to 650 PSIG for the removal of air and non-condensable gases from process equipment, vessels and piping. The air vent should be located at a high point in the system or vessel and can be installed in any orientation.

How It Works

The thermostatic air vent contains a welded stainless steel thermal element that expands when heated and contracts when cooled. When air and non-condensable gases are present, the valve is in the open discharge position. When steam reaches the air vent, the element expands and closes the valve off tightly.

Features

- Welded stainless steel thermal element
- Hardened stainless steel seat and valve plugs for extended service life
- Integral strainer to protect from contamination
- Steam pressures up to 650 PSIG
- Special Subcool Options Available

Sample Specification

Air vent shall have a thermal element with a seal-welded tamper-proof stainless steel construction. All internals shall be stainless steel, featuring an integral strainer and hardened seat and disc.

Installation

The air vent should be located at a high point in the system or vessel and can be installed in any orientation. An isolation valve should be installed to facilitate removal and replacement without system shut-down. Unit is seal-welded and non-repairable.

	Bronze	250#
	Stainless Steel	300#

PRESSURE/TEMPERATURE RATINGS

Cast Iron	NPT	250 PSIG @ 406°F
Bronze	NPT	300 PSIG @ 422°F
Stainless Steel	NPT	450 PSIG @ 400°F

Typical Applications

The Watson McDaniel Cast Iron, Bronze or Stainless Steel **Suction Tee** is a specialized type of pipe fitting used for blending, agitation, recirculation, mixing, aeration and heating.

How It Works

Heating by Direct Steam Injection: When using a Suction Tee for heating by direct steam injection, the Suction Tee must be completely submerged in the liquid being heated. When steam enters the primary inlet side of the Suction Tee, a low pressure condition is created inside the Suction Tee body. This causes the liquid inside the tank to circulate through the suction tee and intermix with the steam, causing the liquid to be heated.

Mixing: When liquid is pumped through the primary inlet of a Suction Tee, a low pressure region is created inside the Suction Tee body. When a Suction Tee is submerged, the liquid inside the tank will circulate through the secondary inlet of the Suction Tee causing a mixing action to occur. An alternate method when mixing two different liquids is to pump one liquid through the primary inlet and the other liquid through the secondary inlet of the Suction Tee.

Aeration: A tank or reservoir of liquid can be aerated by connecting the secondary inlet of the Suction Tee to an air or gas line under pressure while pumping liquid through the primary inlet.

Controlling temperature of large open tank by steam injection

Aeration or Agitation

Syphons, Eductors, Exhausters & Injectors

Model	EJECT EJECT-ELL EJECT-LM
Sizes	1/2" – 2"
Connections	NPT
Body Material	Bronze (1/2" - 1 1/2") Cast Iron (2")
PMO Max. Operating Pressure	100 PSIG
TMO Max. Operating Temperature	130°F
PMA Max. Allowable Pressure	250 PSIG up to 450°F
TMA Max. Allowable Temperature	450°F @ 250 PSIG

Note: Minimum Operating Pressure for EJECT-ELL & EJECT-LM is 20 PSIG.

Typical Applications

Watson McDaniel **Ejectors** perform a variety of functions depending upon the application and motive fluid (steam or water) used. See performance charts on the following pages. Applications include: exhausting, agitating, aerating, circulating, pumping and mixing.

How It Works

Using water, steam or air pressure as the motive force, ejectors operate on the principle that a high velocity flow through a nozzle will create a pressure drop in the area around the nozzle discharge. The resulting vacuum will induce flow into the secondary inlet of the ejector.

Features

- No moving parts
- Can be used with water or steam pressure
- Submersible
- Available in cast iron or bronze

Sample Specification

Ejectors shall be constructed from bronze or cast iron. Units shall be capable of using steam, water or air as a motive force.

Installation

See installation examples on following page.

MATERIALS

Body (1/2" - 1 1/2")	Bronze
Body (2")	Cast Iron
Nozzles (all sizes)	Bronze

Note: EJECT-ELL & EJECT-LM for liquid motive service only.

Model **EJECT** can be used with Steam or Water as the Motive Inlet

Ejectors shown Pumping Liquid

It is always desirable to keep the Ejector as close to the actual liquid being pumped as possible. The maximum height the liquid can be pumped depends upon the pressure of the "motive" liquid or steam available. Please refer to the capacity graphs for maximum flow rates and maximum achievable heads.

The maximum height that water or any liquid with a specific gravity of 1 can be lifted is 25 feet. Increases in the temperature of the liquid being lifted will cause this maximum height to decrease. Pumping liquids in excess of 130°F is not recommended. Please consult factory with any specific application.

Ejector Sizing • EJECT Model

Example 1

A #14 1" Ejector using 60 lbs. of water pressure as a motive force will pump water to a maximum height of 40 ft. When pumping water to a height of 20 ft. using 60 lbs. of water pressure, the amount of water being pumped is 700 gal/hr.

for Model EJECT Only (Water)

Example 2

A #14 1" Ejector using 60 lbs. of steam pressure as a motive force will pump water to a maximum height of 60 ft. When pumping water to a height of 53 ft. using 60 lbs. of steam pressure, the amount of water being pumped is 650 gal/hr.

for Model EJECT Only (Steam)

Ejector Sizing • EJECT Model

for Model **EJECT** Only (Water)

for Model **EJECT** Only (Steam)

Model Code	AV813-13-N *
Sizes	3/4"
Connections	NPT
Body Material	Cast Iron
PMO Max. Operating Pressure	150 PSIG
TMO Max. Operating Temperature	300°F
PMA Max. Allowable Pressure	150 PSIG up to 353°F
TMA Max. Allowable Temperature	353°F @ 150 PSIG

* With Viton seat, use Model Code **AV813V-13-N**

Typical Applications

The **AV813** Air Eliminator is used for the removal of air and other gases from vessels or piping systems without allowing the contained liquid to escape.

How It Works

The valve and seat assembly inside the air eliminator is connected to a stainless steel float. When there is no liquid in the body of the air eliminator, the float will be in the down position, allowing air or other gases in the vessel or piping system to escape. When liquid enters the body, it will lift the float and the valve will be closed off before any liquid can escape.

Features

- Rugged cast iron housing
- Simple design for easy maintenance
- Stainless steel internals
- Optional Viton Valve Head for high temperatures and tight shut-off

Sample Specification

Air Eliminator shall be of cast iron construction with stainless steel internals and soft EPDM seat for tight shut-off. Optional Viton seat is available for elevated temperatures and tight shut-off.

Installation & Maintenance

The AV813 should be located at a high point in the system or vessel. The unit must be installed to operate and upright with flow upward for the float mechanism to operate properly. Isolation valves should be installed for ease of maintenance.

Air Eliminators are used for Removing Air from Liquid Systems

MATERIALS

Cover	Cast Iron, ASTM A-126, Class B

DIMENSIONS — inches

Repairable & Non-Repairable

Model	AE1800, AE1800R
Sizes	1/2", 3/4"
Connections	NPT
Body Material	Stainless Steel
PMO Max. Operating Pressure	400 PSIG
TMO Max. Operating Temperature	500°F
PMA Max. Allowable Pressure	400 PSIG up to 500°F
TMA Max. Allowable Temperature	500°F @ 400 PSIG

Typical Applications

The AE1800 Air Eliminator is used for the removal of air and other gases from vessels or piping systems without allowing the contained liquid to escape.

How It Works

The valve and seat assembly inside the air eliminator is connected to a stainless steel float. When there is no liquid in the body of the air eliminator, the float will be in the down position, allowing air or other gases in the vessel or piping system to escape. When liquid enters the body, it will lift the float and the valve will be closed off before any liquid can escape.

Features

- All stainless steel body and internals
- Hardened SS seat (55 Rc) for longer service life
- Repairable units available (AE1800R Series)

Installation & Maintenance

The AE1800 should be located at a high point in the system or vessel. The unit must be installed level and upright with flow upward for the float mechanism to operate properly. Isolation valves should be installed for ease of maintenance.

3/4" – 3"

WDS
Carbon Steel or
Stainless Steel
(FLG Only)
1/2" – 12"

Typical Applications

The **WDS Series Centrifugal Style Separators** are used for the removal of entrained liquid or particles from steam or air. Effective in applications where the system has entrained liquids of up to 40% by weight of the unit's flow capacity.

How It Works

Wet steam enters the inlet of the separator where it is deflected in a centrifugal downward motion. The entrained moisture is separated out by reduction in its velocity. Separated liquid then falls below the cyclone drip plate where it cannot be re-entrained into the steam or air flow. Dry steam or air then flows upward and exits through the outlet of the separator.

Features

- Removes 99% of all particles ≥ 10 microns in size
- Minimum pressure drop
- Gauge ports available; See chart.
- ASME Code constructed

Sample Specification

Steam / Air Moisture Separator shall be "T" style for horizontal piping installations. Separator to be ASME code constructed in ductile iron, carbon steel, or stainless steel and available in FNPT and flanged connections.

Installation

The WDS Steam / Air Moisture Separator must be installed in a horizontal run of pipe. Exercise standard piping and structural practices when installing this unit. Proper drainage of the separator utilizing a float & thermostatic steam trap or liquid drainer (for air applications) is essential for proper operation.

Impingement Style Moisture Separator for Steam or Air

Ductile Iron

Model	CIS1	CIS3
Sizes	3/4" – 2"	2 1/2" – 4"
Connections	NPT	ANSI 150#/300#
Body Material	Ductile Iron	Ductile Iron
PMO Max. Operating Pressure	360 PSIG	360 PSIG
TMO Max. Operating Temperature	662°F	662°F
PMA Max. Allowable Pressure	360 PSIG @ 662°F	150#: 200 PSIG @ 400°F 300#: 360 PSIG @ 662°F

CIS1
Ductile Iron
(3/4"–2")

CIS3
Ductile Iron
(2 1/2"–4")

Typical Applications

- Impingement style separators are used on steam mains, ahead of steam pressure reducing valves, or temperature control valves
- Also used on the steam inlet to laundry presses and other process equipment which require dry saturated steam
- Placed before air filters on the compressed air systems prior to sensitive instruments

How It Works

When steam or air entrained with moisture enters the separator, a series of baffles change its flow direction several times. During the process, the baffles in the housing collect impinged water droplets that are carried in the vapor. Gravity causes the accumulated water droplets and other foreign particles to fall to the drain and exit through an external trap (trap not include). This allows clean, dry steam or air to exit at the outlet of the separator.

Features

- Removes 99% of all particles ≥ 10 microns in size
- Long-lasting ductile iron construction

Sample Specification

Moisture Separator shall be of the high efficiency impingement type having a pressure drop that does not exceed an equivalent length of pipe. Body shall be ductile iron with threaded or flanged connections. A threaded bottom drain shall be provided for the installation of a trap to discharge any accumulated liquid.

Installation

Install in a horizontal pipeline with the drain directly below the line. Recommended trap is a continuous draining float operated type.

Maintenance

The trap at the separator drain should be serviced periodically according to the manufacturer's instructions. The separator itself requires no maintenance.

Stainless Steel

Model Code	WFPV-12-N
Sizes	1/2"
Connections	NPT
Body Material	Stainless Steel
PMO Max. Operating Pressure	200 PSIG
TMO Max. Operating Temperature	300°F

Typical Applications

The **WFPV** is used for freeze protection on pipes, valves, fittings, pumps, condensate systems, safety showers, fire lines, spray nozzles, freeze sensitive equipment or as backup protection on steam tracing lines.

How It Works

A thermostatic element senses water temperature in the valve. If the temperature falls below 35°F, the valve will modulate open allowing water to drain from the system. The valve will remain open as long as the water flowing by the sensing element is less than 40°F. When the water temperature rises above 40°F, the valve will close.

Features

- Corrosion resistant stainless steel body
- Long service life
- Narrow temperature band
- System pressures will not affect opening temperature

Sample Specification

The freeze protection valve shall have a stainless steel body and be actuated by a thermostatic element that senses water temperature. The unit shall feature a ram-type plug for a tight and reliable shut-off.

Installation

Unit should be installed in a vertical orientation with flow direction downward. For full details, see Installation and Maintenance Manual.

	3/4"	WSPV-13-N
Sizes	1/2", 3/4"	
Connections	NPT	
Body Material	Stainless Steel	
PMO Max. Operating Pressure	200 PSIG	
TMO Max. Operating Temperature	300°F	

Typical Applications

The **WSPV** is used to protect personnel from accidental scalding by over-heated water or other liquids. Installations such as eye-wash stations and safety showers can become over-heated by piping exposed to solar radiation or a heat exchanger malfunction.

How It Works

When water temperature rises above 95°F, the thermal actuator modulates the valve open. If the water exceeds 105°F, the valve will go to full open position in order to discharge the over-heated water. When the water temperature returns to 95°F, the thermal actuator modulates the valve to close.

Features

- Corrosion resistant stainless steel body
- Long service life
- Narrow temperature band
- System pressures will not affect opening temperature

Sample Specification

The scald protection valve shall have a stainless steel body and be actuated by a thermal element that senses water temperature. The unit shall feature a ram-type plug for reliable and tight shut-off.

Installation

Unit should be installed in a vertical orientation with flow direction downward. For full details, see Installation and Maintenance Manual.

WSP = Working Steam Pressure

Normal Open:
Flow is straight through

In Test Position:
Flow discharges through test port

Application & How It Works

The **WSTTV** Steam Trap Test Valve offers simple, immediate, and visible diagnosis of any steam trap. Turning the handle 90° to the "Test" position will direct flow of steam trap out the test port for visual evaluation of discharge.

With the **WSTTV** Steam Trap Test Valve installed downstream of the trap and in the open position, the steam trap discharges normally. A quarter-turn of the handle repositions the specially designed ball and diverts the trap discharge through a port on the bottom of the valve. Discharge can then be observed and assessments made regarding the operation of the steam trap.

Installation

Test Valve to be mounted on the outlet side of the steam trap. Care should be taken to ensure that the discharge port will be positioned in such a manner so as to avoid danger to personnel. NOT AN ISOLATION OR STOP VALVE.

Features

- Seal welded construction
- Full stainless steel construction
- Fully compliant with ASME B16.34 & API 608
- NACE MR-01-75 compliant
- Standard locking stainless steel handles
- Single reduced bore/full porting (depending on size)

Heat Miser Instantaneous Steam to Water Heaters

for Domestic and Process Water Heating Applications

Steam to
Water Heater

The Heat Miser is an Instantaneous Steam to Water Heater which produces hot water from steam. The Watson McDaniel fully-assembled Heat Miser eliminates the need for large hot water storage tanks and saves significant energy which is required for large standing tanks of hot water.

Common Applications: Hospitals, Schools & Universities, Hotels, Process Washdown Stations, Residential Apartment Buildings or any other facility with an existing steam boiler.

Old Hot Water System Negatives

- Takes up excessive floor space
- Stagnating hot water
- Danger of Legionella Growth
- Corrosion of tanks
- Significant radiant heat loss

New Heat Miser System

- Small footprint (typical floor space of 14ft²)
- Efficient plate & frame heat exchanger maximizes turbulent flow for instantaneous hot water on demand
- Stainless Steel waterside components
- Simple maintenance and reduced overall costs

System Benefits

- Meets the rigorous demands of domestic water heating
- Accommodates extreme load fluctuations without the need or storage tanks
- Accurate control of outlet water temperature for many systems to +/- 2°F, and +/- 8°F for wide and sudden load fluctuations
- High-efficiency Plate & Frame Heat Exchanger optimized for use with low pressure steam and offers typical flow rates up to 300 GPM, with higher flow rate designs available
- Integral Control Panel included for ease of operation and system feedback
- Electric and Pneumatic Control Valves available for precise steam control
- Excellent for washdown stations

The Watson McDaniel Difference

- ASME qualified welders and certifications
- ASME U and UM Stamp availability on appropriate components
- Complete assembly and pressure testing prior to shipment
- Better control of design, cost and quality by avoiding 3rd party fabricators
- Unparalleled turn-around and deliveries with many units available for shipment within days

Standard Auxiliary Items

- Steam and Condensate Inlet Y-Strainers
- Stainless Steel Recirculation Pump
- Over-temperature Protection – Solenoid-actuated Cold Water Injection
- Steam Inlet Pressure Gauge
- Stainless Steel RTD Electronic Temperature Sensor
- Stainless Steel Waterside Piping with Pressure & Temperature Safety Valve

Heat Exchanger

- High-efficiency Plate & Frame Counterflow Type
- Single or Double Wall 316 Stainless Steel Plates
- Steam-rated EPDM gaskets
- Plates may easily be added, removed or replaced on site

Control Valve

- Stainless Steel Globe Body
- Fail Closed Pneumatic Actuator
- Electro-Pneumatic Positioner
- Single Seat, Equal Percentage, Soft-Seat Trim

Control Panel

- NEMA 4X Electrical Enclosure
- Electronic PID Controller with Full Auto-Tune Capability
- Selector Switches – Controller On/Off and Pump On/Off
- All components to be pre-wired for 120V service

Condensate Outlet

Steam Inlet

Hot Water Outlet

Cold Water Inlet

Condensate Drainage Options

Float & Thermostatic Steam Trap (gravity drainage option)

- All Stainless Steel Internals
- Body Material options include Ductile Iron, Carbon Steel and Stainless Steel

Pump-Trap Combination (pumped drainage option)

- Patented Snap-Assure mechanism with stainless steel wear parts
- Ductile Iron Tank
- Gauge Glass
- Motive PRV, Drip Trap, and Motive and Vent Piping

Common Optional Items

- High-limit Steam Isolation Package including dedicated RTD sensor and actuated ball valve (2" and under) or butterfly valve
- HD-PP Pressure Reducing Valve for reducing inlet steam supply pressure to the control valve
- NANODAC PID controller with data recording and Modbus or BACnet communication protocol

Watson McDaniel offers five standard packages, or you can customize your own Heat Miser.

Capacities:	Up to 300 GPM
Connections	Threaded Unions
PMO Max Operating Pressure	150 PSIG
Pressure/ Temperature Ratings	150 PSIG @ 250°F

Typical Applications

The **WMS Series** Mixing Station provides extremely accurate and precise hot water temperature control in pumped hot water recirculation systems. It is typically installed directly after a domestic water heating source such as a Heat Miser to monitor and control a consistent hot water outlet temperature. Circulating hot water in the facility flows through the mixing station while sensors monitor the water temperature. Hot water from the Heat Miser and a separate cold water source connect to the 3-way blending valve. When the circulating water temperature falls below the set point, the 3-way valve modulates to allow more hot water from the Heat Miser in to raise the recirculation loop temperature. Conversely, if the recirculation loop temperature exceeds set point the 3-way valve modulates to allow more cooling water in to reduce the temperature. Therefore, the WMS Mixing Station can help reduce cycling of the supply control valve installed to the main water heating source resulting in more accurate and consistent water temperature control. A PID controller with color display is included which also supports communication protocols for Modbus and BACnet for remote monitoring and control.

Features

- Maintains +/-2°F at downstream point of service, min 25 ft.
- Programmable set temperature, 80-180°F
- Controller includes data logging, color display, & Modbus/ BACnet
- Pre-wired for 120vac power supply
- Fail-safe hot water shut-off on loss of power or loss of cold water
- High and Low temperature alarms
- Keylock thermal sanitation cycle to kill bacteria (Legionella)
- Optional high limit hot water isolation
- 150 PSIG max pressure at 250°F
- Wetted materials: copper, lead-free brass and 316L stainless steel
- Assembled on a frame for wall mount or optional floor mount

Single Tube Humidifier

Single Tube (WSI)

- For direct injection of steam humidification into air stream
- Many tube length options to accommodate various duct widths
- Recommended for relatively small duct heights where dissipation distance is not critical

Multiple Tube Humidifier

Multiple Tube (WSI)

- Used for improved dissipation distances in duct heights above 20"
- Number of tubes can be selected to optimize performance
- Many tube length options to accommodate various duct widths

Insty-Pac Manifold-Style Humidifier

Insty-Pac (WIP)

- Custom-engineered manifold design for job-specific requirements
- Used when dissipation distances are critical for optimum air stream humidification
- Number of tubes properly selected to achieve design requirements

Humidification Overview

Steam Heat Exchanger (WSX)

- Provides humidification for today's stringent indoor air quality requirements
- Utilizes boiler steam to heat tap water providing injection steam free from chemical or mineral carry-over
- Ideal for use where electric humidifiers would be cost-prohibitive

Mini-Mult Front View

Mini-Mult

- Designed for applications that require small humidification loads in a small duct size
- Ideal for any high humidity job where fast steam dissipation in cool air in a short-run duct is essential
- Number of tubes can be specified per duct size and job requirements

Area Type

- Designed for applications that require humidification without the use of duct work
- Ideal for area humidity control in paper, textile or wood manufacturing applications as well as printing plants and storage areas

Series "WSI"
Steam Injection
Humidifiers

Series "WIP"
INSTY-PAC
Steam Injection
Humidifiers

Typical Applications

A Steam Injection Humidifier supplies precise humidity control from the facility steam boiler into the air stream. Typically used in manufacturing plants, printing plants, commercial offices, hospitals and any other facilities which require a critical balance between temperature and humidity control.

How It Works

The Steam Injection Humidifier receives steam directly from the boiler (live steam), removes the condensate and injects the dry steam into the duct work or an air stream. Live steam enters a steam jacket to preheat the injection tube. Steam then flows into the separator where condensate is removed. Dry steam is then discharged through the injection tube for circulation into the air stream.

MATERIALS

Separator	304 SS
Dispersion Tube	304 SST

Features

- Provides accurate humidity control
- Simple and cost efficient system to meet high humidity requirements
- Available for regular or purified boiler steam
- Available for single or multiple tube applications
- Capacities up to 2900 lbs/hr
- Pressure ranges from 2-60 PSIG
- Available for pneumatic or electric controls
- All stainless steel distributors and nozzles ensure permanent bond
- Separator and Steam Jacket included to provide highest quality steam

Installation

Distributor must be mounted level in a straight section of duct, with steam outlets facing into the air stream. A steam trap should be installed on the separator outlet, allowing for proper condensate removal. Also include a strainer upstream of humidifier inlet.

Maintenance

The strainer should be cleaned periodically. The valve, actuator, steam trap and temperature switch should be inspected annually to confirm proper operation. For full maintenance details, see installation and maintenance manual.

HOW TO ORDER

Consult factory for sizing and selection. Provide required humidification load, steam pressure at humidifier inlet, duct dimensions, actuator type and any accessories.

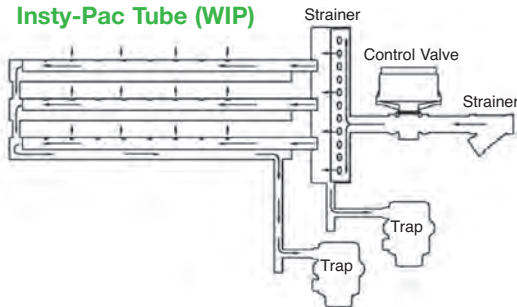

Single Tube (WSI)

Multiple Tube (WSI)

Insty-Pac Tube (WIP)

To prevent condensation on in-duct objects, such as dampeners, coils, filters or turning vanes, it is very important that the dissipation distance be shorter than the distance from the humidifier to the in-duct object. The following recommendations should be used when designing a multiple injection tube system:

Duct Height	Recommended Qty. of Tubes †
Up to 36"	2
37" – 48"	3
49" – 72"	4
73" – 96"	5
Above 96"	6

† Final duct relative humidity, air velocity and available dissipation distance will affect the quantity of tubes required.

Typical Applications

Steam Heat Exchanger Humidifiers can be used for humidification applications where steam injection is to be used, but chemically treated boiler steam is not allowable. They provide humidification to meet stringent indoor air quality requirements and are ideal for use where electric humidifiers would be cost-prohibitive.

How It Works

The **WSX Steam Heat Exchanger Humidifier** works by utilizing existing boiler steam to heat tap water, providing injection steam free from chemical or mineral carry-over. Several steam injection dispersion methods are available to suit the application requirements.

Features

- Single unit capacity up to 2,035 lbs/hr
- 304 Stainless Steel reservoir construction
- Stainless Steel heat exchanger
- Unique side-entry heat exchanger provides a large clean out access section without disturbing the cover or injection tube system's steam supply piping
- Pneumatic modulating steam control valve
- Tri-Probe level controller
- Adjustable surface water flusher
- Motorized drain valve with brass body
- User-adjustable automatic drain system
- Float & Thermostatic steam trap(s)
- Inlet "Y" strainer(s)

Options

- INTAC microprocessor controller
- Electric modulating actuator
- Factory-mounted control panel
- NEMA 4 weather-tight control panel
- Control panel door lock
- Seasonal End-of-Use drain system
- Door interlock safety switch
- Factory-insulated reservoir
- Support legs
- Wall brackets
- Freeze protection
- Stand-by water temperature sensing
- Blower Pack for area humidification
- Variable air volume control
- Outdoor air temperature sensing
- Drain tempering kit
- Remote INTAC microprocessor controller
- Outdoor enclosure

Humidifier Capacity – lbs/hr (kg/hr) †				
Model	Steam Pressure in at the control valve – PSIG (kPa)			
	5 (34.5)	10 (69.0)	13 (89.6)	15 (103.4)
SX-1R	32 (14.5)	76 (34.5)	100 (45.3)	122 (55.3)
SX-2R	52 (23.6)	108 (48.9)	140 (63.5)	169 (76.7)
SX-3R	102 (46.3)	228 (103.4)	292 (132.5)	348 (157.8)
SX-4R	192 (87.1)	484 (219.5)	655 (297.1)	753 (341.7)
SX-8R	370 (167.8)	840 (381.0)	1200 (544.3)	1350 (612.4)
SX-12R	560 (254.0)	1265 (573.8)	1810 (821.0)	2035 (923.1)

† Actual humidifier capacity may vary due to the heat loss from the humidifier reservoir. The ambient air temperature, air velocity and injection tube system will affect the rate of the heat loss from the reservoir.

The capacities shown are based on a non-insulated humidifier reservoir tested in a 70°F environment.

Steam Traps

Replacement Parts & Kits for Float & Thermostatic Steam Traps

FT Series

Float & Thermostatic Steam Trap Parts & Kits

Thermostat Kit:

- (1) welded stainless steel thermostat
- (1) thermostat gasket.

Lever & Seat Assembly: (does not include float)

- (1) lever
- (1) seat
- (1) disc
- (1) seat gasket

Cover Assembly Kit: (consists of all items below assembled to trap cover)

- (1) trap cover
- (1) lever & seat assembly
- (1) float & screw
- (1) thermostat kit
- (1) cover gasket

Steam Traps

Replacement Parts & Kits for Thermostatic Steam Traps

WT1500 Series Thermostatic Steam Trap Kits

Size	Seat Material	Order #
1/2"	Stainless Steel	W-KIT-1500

Kit consists of:
 (1) thermal element
 (1) screen
 (1) spring

WT2500 Series Thermostatic Steam Trap Kits

Size	Seat Material	Orifice Size	Kit Order #
1/2" & 3/4"	Stainless Steel	3/16"	W-KIT-2501
	Stainless Steel	5/16"	W-KIT-2503

Kit consists of:
 (1) seat
 (1) thermal element
 (1) cover gasket
 (1) seat gasket

WT3000 & WT4000 Series Thermostatic Steam Trap Parts & Kits

Size	For Models	Orifice Size	Kit Order #	Cross Reference Nicholson
1/2", 3/4" & 1"	WT3001/3001S/3001SB	3/16"	W-KIT-400-51	400-4
1/2", 3/4" & 1"	WT3003/3003S/3003SB	5/16"	W-KIT-400-53	400-5
3/4" & 1"	WT4001/4001S/4001SB	5/16"	W-KIT-400-60	400-6
3/4" & 1"	WT4003/4003S/4003SB	7/16"	W-KIT-400-62	400-10

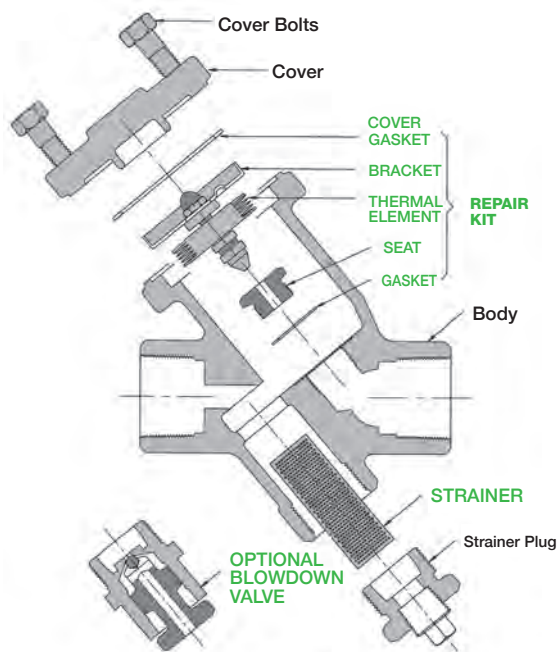

Kit consists of:
 (1) bracket (bellows cup)
 (1) thermal element
 (1) valve seat
 (1) cover gasket
 (1) valve seat gasket

Cover Gasket

Size	For Models	Kit Order #	Cross Reference Nicholson
All	WT3000 Series	W-KIT-410-50	410-2
All	WT4000 Series	W-KIT-410-51	410-4

Blowdown Valve & Strainer

Size	For Models	Item	Order #
All	WT3000SB WT4000SB UC450SB	Blowdown Valve Assembly	WBLDNVLV-TRAPS
All	WT3000SB WT4000SB UC450SB	Strainer Screen	1532002

WT5000 Series Externally Adjustable Bi-Metallic Steam Trap Kits

Size	For Models	PMO PSI	Kit Order #
1/2", 3/4" & 1"	WT5000	650	W-KIT-WT5000

Cross Reference: TLV Model LEX3N-TZ

Kit consists of:
 (1) thermal element
 (1) valve seat
 (1) cover gasket
 (1) valve seat gasket
 (1) screen

BM300 Bi-Metallic Steam Trap Parts & Kits			
Size	Item	PMO PSI	Kit Order #
	Thermal Controller Assembly*		2667100
1/2"	Bonnet Gasket		2692300
3/4"	Blowdown Valve Assembly		WBLDNVLV-TRAPS
1"	Strainer Screen		1532002
	Strainer Gasket		2378800

Cross Reference: **Gestra Model BK45**

Kit consists of:

- (1) bi-metal element
- (1) valve
- (1) seat

Note: Controller assembly threads into body;
Individual parts not available.

UTS600 Series Universal Steam Trap Station

SDM & CCM Series Manifolds - Steam Distribution and Condensate Collection

Isolation Valve Assembly**			
Size	For Model	Item	Order #
All	UTS600/SDM & CCM	Isolation Valve Assembly	UTS600-IS-VLV

Note: UTS600 has (2) Isolation Valves.

*Valve Assemblies ordered individually; individual parts not available.

- Kit consists of:
- | | |
|---------------------|----------------------|
| (1) bonnet | (2) valve rings |
| (2) nuts | (1) packing assembly |
| 2) washers | (1) handwheel |
| (1) piston | (with nut & washer) |
| (1) valve stem | (1) large gasket |
| (1) lantern bushing | (1) small gasket |

Blowdown Valve Assembly- For UTS600 Series Only

Size	For Model	Item	Order #
All	UTS600SB	Blowdown Valve Assembly	WBLDNVLV-TRAPS
All	UTS600	Test Valve Assembly	UTS600-TEST-VLV
All	UTS600	Strainer Screen	1532002

Pumps

Replacement Parts & Kits for Pressure Motive Pumps

NEW Assemblies & Parts for Pressure Motive Pumps

For Model (All Sizes)	Kit Order #	Description	Weight lbs
PMPM	W-KIT-901-04	Cover gasket for PMPM	3
	W-KIT-901-06	Float & cover gasket for PMPM	3
	W-KIT-901-05	Inlet & vent valve assembly for PMPM	5
	W-KIT-901-08	Spring assembly for PMPM	5
	W-KIT-916-03	Complete mechanism assembly for PMPM less cover	5
	W-KIT-911-03 *	Complete mechanism assembly for PMPM	95
PMPE, PMPC, PMPSP, PMPSS & PMPLS All Sizes	W-KIT-900-03 *	New mechanism assembly for PMPE, PMPSP	30
	W-KIT-910-03 *	New mechanism assembly for PMPC, PMPLS	30
	W-KIT-920-03 *	New mechanism assembly for PMPSS	30
	W-KIT-900-04	Cover gasket for PMPE, PMPC, PMPLS, PMPSP, PMPSS	3
	W-KIT-900-05	Inlet & vent valve assembly for PMPE, PMPC, PMPLS PMPSP, PMPSS	5
	W-KIT-900-06	Float & cover gasket for PMPE, PMPC, PMPLS, PMPSP, PMPSS	10
	W-KIT-900-08	Spring assembly for PMPE, PMPC, PMPLS, PMPSP, PMPSS	5
	W-KIT-904-03	PMP Head Assembly, Johnson LMV Complete	28
PMPBP 4" x 4"	W-KIT-900-02 *	New standard mechanism assembly for PMPBP 150# FLG (high flow, large vent, 50 PSI max. BP)	130
	W-KIT-900-02-HBP *	New High-BP mechanism assembly for PMPBP 150# FLG	130
	W-KIT-900-07 *	New Standard mechanism assembly for PMPBP 300# FLG (high flow, large vent, 50 PSI max. BP)	185
	W-KIT-900-07-HBP *	New High-BP mechanism assembly for PMPBP 300# FLG	185
	W-KIT-900-01 *	New standard drop-in replacement mechanism assembly for SSI model (high flow, large vent, 50 PSI max. BP)	110
	W-KIT-900-01-HBP *	New high-BP drop-in replacement mechanism assembly for SSI model	110
	W-KIT-910-14-SSI	Cover gasket for SSI mechanism assembly	7
	W-KIT-910-14-150	Cover gasket for PMPBP mechanism assembly, 150# FLG	7
	W-KIT-910-14-300	Cover gasket for PMPBP mechanism assembly, 300# FLG	7
	W-KIT-900-15	Inlet & vent valve assembly for standard PMPBP/SSI (large vent)	12
	W-KIT-900-15-HBP	Inlet & vent valve assembly for High - BP PMPBP/SSI	12
	W-KIT-900-16	Float for PMPBP - All models	20
	W-KIT-900-18	Spring set for PMPBP - All models	10

Notes: For purchasing Stainless Steel Check Valves 1/2" - 3" NPT — See Check Valves Model WSSCV, in Pipeline Accessories Section.

* Complete Mechanism Assemblies include Cover Gasket.

6"	W-KIT-800-22	W-KIT-801-22	W-KIT-819-22	W-KIT-820-22

Notes: 1) Low-Pressure replacement kits available. Bronze diaphragms replaced with EPDM diaphragms.

Add **LP** suffix code to above Order Numbers. Example: W-KIT-800-13-**LP**.

2) Low-Differential replacement kits use same Order Numbers as above.

3) Stainless Steel diaphragms available; Consult factory.

¹ HD Maintenance Kit (800 Series) Consists of :

- (1) bottom cover gasket
- (2) diaphragm gaskets
- (2) Bronze diaphragms
- (1) pilot adapter gasket
- (1) strainer screen
- (1) Copper gasket

² Complete Rebuild Kit (801 Series) Consists of:

- (1) HD Maintenance Kit (800 Series; above)
- (1) disc & stem assembly

³ External Tubing Kit :

- (1) Pilot to Body Copper Tube
- (1) Pilot to Diaphragm Copper Tube
- (4) Ferrules and Ferrule Nuts
- (1) Pressure Orifice
- (1) Diaphragm Orifice Assembly

Stainless Steel Tubing Kit Option:

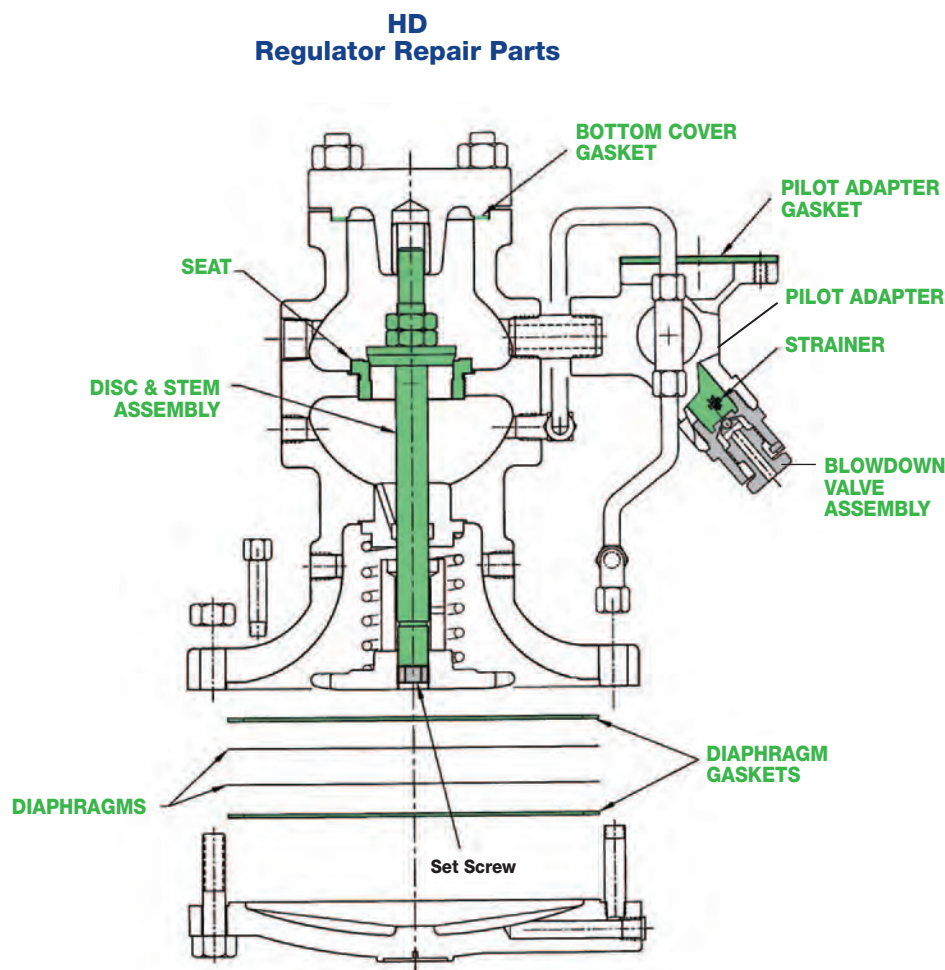

- W-KIT-819-13-SS
- W-KIT-819-14-SS
- W-KIT-819-15-SS
- W-KIT-819-16-SS
- W-KIT-819-17-SS
- W-KIT-819-18-SS
- W-KIT-819-19-SS
- W-KIT-819-20-SS

⁴ By-Pass External Tubing Kit :

- (1) Body Copper Tube - Bleed Port to Diaphragm Chamber
- (2) Compression Tube Fitting Elbows
- (1) Male Branch Tee

Additional Options:

- a) Blowdown Valve Assembly:
Order #: **W-KIT-800-11**
- b) Gasket for Pilot Adapter:
Order #: **1762900**
- c) Reduced Port Kits; Consult factory.
- d) Replacement Pilot Adapter:
Order #: **ZDHD-18-19-20**

Pilots – HD Regulator

Replacement Parts & Kits for Pilots used with HD Regulator

PP & PP5 Pressure Pilots Repair Kits

Kit Order #	Description
W-KIT-802-01	Series PP Pressure Pilot Kit
W-KIT-802-02	Series PP - 2 Diaphragms & bottom spring button only
W-KIT-854-04	Series PP5 Pressure Pilot Kit

PP & PP5 Pressure Pilot Kit Consists of:

- (2) diaphragms
- (1) head & seat assembly
- (1) seat gasket
- (1) pilot adapter gasket
- (1) diaphragm gasket (PP5 only)

PBP Back Pressure Pilot Repair Kits

Kit Order #	Description
W-KIT-803-01	PBP Back Pressure Pilot Kit

PBP Back Pressure Pilot Kit Consists of:

- (2) diaphragms
- (1) head & seat assembly
- (1) seat gasket
- (1) pilot adapter gasket

PDP Differential Pilot Repair Kits

Kit Order #	Description
W-KIT-806-01	PDP Differential Pressure Pilot Kit

Note: Spence replacement kits available. Add **SP** suffix code to the above Order Numbers.
Example: W-KIT-802-01-**SP**

PDP Differential Pilot Kit Consists of:

- (2) diaphragms
- (1) head & seat assembly
- (1) cap gasket
- (1) seat gasket
- (1) pilot adapter gasket

PP & PP5 Pressure Pilot Repair Kit

PBP Back Pressure Pilot Repair Kit

PDP Differential Pilot Repair Kit

PA Series Air Pilots Repair Kits

Kit Order #	Description
W-KIT-804-01	PA1 (1:1) Air Pilot Kit
W-KIT-804-04	PA4 (4:1) Air Pilot Kit
W-KIT-804-06	PA6 (6:1) Air Pilot Kit

Note: Spence replacement kits available. Add **SP** suffix code to the above Order Numbers.
Example: W-KIT-804-01-**SP**

Kit Consists of:

- (2) upper diaphragms
- (2) pilot diaphragms
- (1) head & seat assembly
- (1) seat gasket
- (1) pilot adapter gasket

PA Air Pilot Repair Kit

PT & PTU Temperature Pilots Repair Kits

Kit Order #	Description
W-KIT-805-01	PT & PTU Pilot Kit
W-KIT-805-02	PT & PTU Low Pressure Pilot Kit

Kit Consists of:

- (1) head & guide assembly
- (1) seat & seat gasket
- (1) pilot adapter gasket
- (1) guide gasket

PT & PTU Temperature Pilot Repair Kit

HEAD & SEAT ASSEMBLY
Includes highlighted items

HSP Pilot-Operated Regulator

Replacement Parts & Kits for HSP Regulators

Cast Steel or Stainless Steel Regulator

HSP & HSP-SS Series

- (1) bottom cover gasket
- (1) diaphragm
- (1) pilot adapter gasket
- (1) strainer screen

² Complete Rebuild Kit for HSP Consists of:

- (1) 810 Series Maintenance Kit
- (1) disc & stem assembly

³ External Tubing Kit:

- (1) Pilot to Body SST Tube
- (1) Pilot to Diaphragm SST Tube
- (4) Ferrules and Ferrule Nuts
- (1) Pressure Orifice
- (1) Diaphragm Orifice Assembly

HSP Regulator Repair Parts

Additional Options:

- a) Blowdown Valve Assembly for HSP:
Order #: **Kit-800-11-HSP**
- b) **Reduced Port Kits** - Contact Factory
- c) **External Tubing Kits** - Contact Factory
- d) **Pilot Adapter Gasket**
Order #: **1536402**

PHSP & PHSP-SS Series Pilots

Replacement Pressure Pilots & Repair Kit

HSP Kit Order #	HSP-SS Kit Order #	Description
PHSP-Y	PHSP-SS-Y	Pressure Pilot, 10-40 PSI (Yellow)
PHSP-B	PHSP-SS-B	Pressure Pilot, 25-100 PSI (Blue)
PHSP-R	PHSP-SS-R	Pressure Pilot, 75-300 PSI (Red)
W-KIT-812-01	W-KIT-812-01	Pressure Pilot Kit

Pressure Pilot Kit Consists of:

- (1) diaphragm
- (1) disc
- (1) seat
- (1) spring
- (1) stem & cup

Ductile Iron - Carbon Steel - Stainless Steel Regulators

DL Series

Dome-Loaded Regulator Parts & Kits

Size	Maintenance Kit ¹ Order #
1/2" & 3/4"	W-KIT-1800-13
1"	W-KIT-1800-14
1 1/4"	W-KIT-1800-15
1 1/2"	W-KIT-1800-16

**3/4" HC &
1" – 2" Sizes**

**3/8", 1/2" & 3/4"
Sizes**

Kits for 3/8", 1/2" & 3/4" Sizes consist of:

- (1) cover gasket
- (2) Bronze or SS; or (1) Viton diaphragm
- (1) set of diaphragm cover fasteners
- (1) main spring

Kits for 3/4" HC Thru 2" Sizes also include:

- (1) screen
- (1) bottom cover gasket

*Note: Kits are for standard O Valves with metal seating. For O Valves with soft-seating, add Suffix Code from below to standard kit Order # above. Soft-seat kits include the standard parts listed above, and add the following. Select One:

- (1) Teflon Replacement Disc
(Suffix Code - 6T)

"B" Series

Pressure Regulator Kits

Size	Viton Kit Order #
1/2", 3/4"	W-KIT-200-01V

2 1/2"	W-KIT-450-07
3"	W-KIT-450-08
4"	W-KIT-450-09

Kits consist of:
 (1) pilot seat
 (1) pilot disc
 (2) bronze diaphragms
 (1) diaphragm gasket
 (1) diaphragm spring
 (1) strainer screen
 (1) pilot body gasket

*Note 403 (and older 402) Series Kits contain Bronze diaphragms. Stainless Steel available upon request; Contact factory.

Direct-Operated Regulators

Replacement Parts & Kits for Relief & Back Pressure Valves

10691 Series Back Pressure / Relief Valve Kits

Size	Pressure Range PSI	Kit Order #
1/2"	75-300	W-KIT-40-1
	25-100	W-KIT-40-2
	5-35	W-KIT-40-3
3/4"	75-300	W-KIT-41-1
	25-100	W-KIT-41-2
	5-35	W-KIT-41-3
1"	75-300	W-KIT-42-1
	25-100	W-KIT-42-2
	5-35	W-KIT-42-3

For Viton or Teflon Disc, Add **V** or **T** to part number.

Example for Viton: **W-KIT-42-3-V**

Kits consist of:

- (1) disc
- (1) disc follower
- (1) disc holder
- (1) spring
- (1) gasket

3040 Series Back Pressure / Relief Valve Kits

Size	Standard Trim Kit Order #
1/2", 3/4", 1"	W-KIT-3040-14
1 1/4"	W-KIT-3040-15
1 1/2"	W-KIT-3040-16
2"*	W-KIT-3040-17

Kits consist of:

- (1) valve disc (Viton)
- (1) diaphragm (Viton)
- (1) set of fasteners

2" size also includes:

- (1) top gasket

* For 2" 3040 purchased after Dec 31, 2022, add **X** at end of part number.

Example: **W-KIT-3040-17-X**

HB Series 2-Way & 3-Way Control Valve Parts & Kits

Valve Kits (Pneumatic or Electric)

Kit # 100

- 4 Stem seal spring
- 5 Guide bushing
- 7 V-ring stem seals
- 11 Body gasket
- 13 Packing O-ring

Kit # 101

- 1 Stem & Plug Assembly
- 4 Stem seal spring
- 5 Guide bushing
- 7 V-ring stem seals
- 11 Body gasket
- 13 Packing O-ring

Valve & Actuator Kits

Kit # 100

- 18 Diaphragm
- 24 Stem O-ring
- 25 Yoke O-ring
- 26 Upper guide O-ring
- 4 Stem seal spring
- 5 Guide bushing
- 7 V-ring stem seals
- 11 Body gasket
- 13 Packing O-ring

Kit # 101

- 1 Stem & Plug Assembly
- 18 Diaphragm
- 24 Stem O-ring
- 25 Yoke O-ring
- 26 Upper guide O-ring
- 4 Stem seal spring
- 5 Guide bushing
- 7 V-ring stem seals
- 11 Body gasket
- 13 Packing O-ring

MATERIALS • Actuator

18	Diaphragm	Nylon reinforced Neoprene
24	Stem O-ring	Viton
25	Yoke O-ring	Viton
26	Upper guide O-ring	Viton

MATERIALS • Valve Body

1	Stem & Plug	316 SS / 420
4	Stem Seal Spring	302 Stainless Steel
5	Guide Bushing	Rulon 641
7	V-ring Stem Seals	PTFE
11	Body Gasket	303 Stainless Steel
13	Packing O-Ring	Aflas

Valve Kit Model Code Example: 100-01-0-0-0-0

		W-KIT-6-51	Lever & Seat Assembly

Note:

Reference FT600 Parts Section for additional detailed drawings.
All internal parts of WLD600 are identical to FT600, except WLD600
Liquid Drainers do not include a thermostat.

Liquid Drainers & Air Eliminators

Replacement Parts & Kits for Air Eliminators & Liquid Drainers

WLD1800R Series Liquid Drainer Kits

Model	Kit Order #	Description	PMO (PSI)
WLD1800R - All	W-KIT-3-29	Gasket	—
WLD1800R - All	W-KIT-5-31	Float	—
WLD1810R	W-KIT-6-46	Lever & Seat (.078 dia.)	400
WLD1820R	W-KIT-6-47	Lever & Seat (.101 dia.)	255
WLD1830R	W-KIT-6-48	Lever & Seat (.125 dia.)	175

AV813 Series Air Eliminator Parts & Kits

For Model	Kit Order #	Description	Cross Reference Spirax Sarco
AV813	W-KIT-813-01	Gasket	13WS
AV813	W-KIT-813-02	Lever & Disc, Seat	13WS
AV813	W-KIT-813-03	Cover Assembly *	13WS
AV813	W-KIT-813-04	Lever & Viton Seat	13WS

* Cover Assembly Consists of:
 (1) lever & disc
 (1) seat
 (1) cover gasket
 (1) float
 All fully assembled to cover.

AE1800R Series Air Eliminator Parts & Kits

For Model	Kit Order #	Description	PMO (PSI)

This table may be used in two ways:

- (1) Multiply the unit under column A by the figure under column B; the result is the unit under column C.
- (2) Divide the unit under column C by the figure under column B; the result is the unit under column A.

FORMULAS, CONVERSIONS & GUIDELINES

CAPACITY FORMULAS FOR STEAM LOADS

Definition of Terms and Units:

Q_S = Steam Load or Steam Capacity (lbs/hr)

E = Heat Load (Btu/hr)

m = Amount of water to cool per time (lbs/hr)

C_P = Specific Heat of fluid being heated (Btu/(lb-°F))

C_{P1} = Specific heat of solid being heated (Btu/(lb-°F))

ΔT = Temperature rise (°F)

ΔT_1 = Condensate Temp. - Temp. Set Point (°F)

ΔT_2 = Temperature difference (°F)
(Temp. set point - temp. of cooling water)

LH = Latent Heat of Saturated Steam (Btu/lb)

$s.g.$ = Specific gravity of fluid

Q_W = Flow rate of water (GPM)

Q_L = Flow rate of liquid (GPM)

Q_{air} = Flow rate of air (CFM or ft³/min)

G = Volume of liquid to be heated (gallons)

t = Time to heat product (hours)

W = Weight of material (lbs)

p_{air} = Density of air (lb/ft³)

500 = 60 min/hr x 8.33 lbs/gal (convert GPM of water to lbs/hr)

APPROXIMATE FORMULAS

When Heating Water with Steam

$$Q_S = \frac{Q_W}{2} \times \Delta T$$

When Heating Fuel Oil with Steam

$$Q_S = \frac{Q_L}{4} \times \Delta T$$

When Heating Air Coils with Steam

$$Q_S = \frac{Q_{air}}{900} \times \Delta T$$

When Heat Load (Btu/hr) is Known

$$Q_S = \frac{E}{1000}$$

EXACT FORMULAS

$$Q_S = \frac{Q_W \times \Delta T \times 500}{LH}$$

$$Q_S = \frac{Q_L \times \Delta T \times C_P \times 500 \times s.g.}{LH}$$

$$Q_S = \frac{Q_{air} \times 0.24 \times p_{air} \times 60(\text{min/hr}) \times \Delta T}{LH}$$

$$Q_S = \frac{E}{LH}$$

When Boiler Output (H.P.) is Known

$$Q_S = \text{Boiler H.P.} \times 34.5$$

Heating Water in Open-Top Tank with Direct Steam Injection

$$Q_S = \frac{G \times \Delta T \times 8.33 \text{ (lbs/gal)}}{LH \times t}$$

When Square Feet Equivalent Direct Radiation (EDR) is Known

$$Q_S = \frac{EDR}{4}$$

Heating Liquid in Jacketed Kettles

$$Q_S = \frac{G \times s.g. \times C_P \times \Delta T \times 8.33 \text{ (lbs/gal)}}{LH \times t}$$

Condensate Cooling using Water

Step 1: $E = m\Delta T_1$

Step 2: $Q_S = E/\Delta T_2$

Step 3: Water required: $Q_W(\text{GPM}) = Q_S/500$

Heating Solids by Direct Steam Injection into Chamber (Platens, Autoclaves, etc.)

$$Q_S = \frac{W \times C_{P1} \times \Delta T}{LH \times t}$$

FORMULAS, CONVERSIONS & GUIDELINES

FORMULAS FOR CONTROL VALVE SIZING FOR LIQUIDS

The following formulas for Control Valve Sizing assume turbulent flow based on liquids similar in viscosity to water, and pipe sizes equal to the size of the valve ports, with no attached fittings.

C_v = Valve Flow Coefficient
 Q = Volumetric Flow Rate of Liquid (US GPM)
 P_1 = Absolute Inlet Pressure (psia)
 P_2 = Absolute Outlet Pressure (psia)
 ΔP = Pressure Drop (psi) = $P_1 - P_2$
 G = Specific Gravity of the Liquid
 P_v = Vapor Pressure of the Liquid

For Normal Flow:

When: $\Delta P < K_c (P_1 - P_v)$:

$$Q = C_v \sqrt{\frac{\Delta P}{G}} \quad \text{Flow Rate based on } C_v \text{ and } \Delta P.$$

$$C_v = Q \sqrt{\frac{G}{\Delta P}} \quad C_v \text{ required based on Flow Rate and } \Delta P.$$

$$\Delta P = \left[\frac{Q}{C_v} \right]^2 G \quad \text{Pressure drop across valve based on Flow Rate and } C_v.$$

Potential for Cavitation

Cavitation can occur when the pressure inside the control valve drops below the vapor pressure (P_v) of the liquid. Cavitation should be avoided because it restricts flow rate, generates noise and may reduce life expectancy of internal components. When $\Delta P < K_c (P_1 - P_v)$, the Standard Flow Equation will predict performance. When $\Delta P \geq K_c (P_1 - P_v)$, cavitation may occur and the accuracy of the normal flow equation may be reduced.

F_L = The Valve Pressure Recovery Factor.
 For Globe Style Control Valve, $F_L = 0.9$

$K_c = 0.65 F_L^2$ Based on when a 2% reduction of normal flow rate occurs. (0.65 proportionality constant is used for conservative determination of cavitation)

P_v = Vapor Pressure of the Liquid (psia).
 (see chart for water at various temperatures.)

Valve Sizing Example:

A control valve is needed that will handle a maximum flow rate of 100 GPM of water @ 180°F. Since the temperature of the water is elevated, cavitation becomes a concern. Determine the maximum pressure drop across the control valve before cavitation will occur. Based on this maximum pressure drop, determine the required minimum C_v value of the control valve.

Conditions of Service:

$Q = 100$ GPM
 $T = 180^\circ\text{F}$ Water
 $P_1 = 50$ psig = 64.7 psia

Water Physical Properties		
Temp. (°F)	G (Ref. to 60°F)	P_v (psia)
32	1.001	0.09
40	1.001	0.12
50	1.001	0.18
60	1.000	0.26
70	0.999	0.36
80	0.998	0.51
90	0.996	0.70
100	0.994	0.95
120	0.990	1.69
140	0.985	2.89
160	0.979	4.74
180	0.972	7.51
200	0.964	11.5
212	0.959	14.7

- ① To Determine the ΔP across the valve when cavitation could potentially occur, use the formula $\Delta P_c = K_c (P_1 - P_v)$.

$$\begin{aligned}
 \Delta P_c &= K_c (P_1 - P_v) & K_c &= 0.65 F_L^2 = 0.65 (0.9)^2 = 0.53 \\
 &= 0.53 (64.7 - 7.51) & & \text{(for globe valve)} \\
 &= 30 \text{ psi} & P_v &= 7.51 @ 180^\circ\text{F for water} \\
 & & & \text{(see chart)}
 \end{aligned}$$

- ② Determine the minimum C_v of the control valve at the maximum ΔP of 30 psi.

$$\begin{aligned}
 C_v &= Q \sqrt{\frac{G}{\Delta P}} & G &= 0.972 @ 180^\circ\text{F for water} \\
 &= 100 \sqrt{\frac{0.972}{30}} & & \text{(see chart)} \\
 &= 18
 \end{aligned}$$

NOTE: Since a minimum C_v of 18 was calculated, we could choose a 1-1/2" HB globe style control valve which has a $C_v = 22$.

FORMULAS, CONVERSIONS & GUIDELINES

FORMULAS FOR VALVE SIZING

Control Valve Sizing for Saturated Steam

The following formulas for Valve Sizing are based on ISA Standard 75.01.01-2007 (60534-2-1 Mod). The formulas assume pipe sizes equal to the size of the valve ports, with no attached fittings.

Cv = Valve Flow Coefficient	g = Heat Capacity Ratio for Steam = 1.3 (0-300 psig)
DP = Pressure Drop = $P_1 - P_2$	F_g = Heat Capacity Ratio Factor for Steam = $g/1.4 = 1.3/1.4=0.93$
P₁ = Absolute Inlet Pressure (psia)	x = Pressure Drop Ratio = DP/P_1
P₂ = Absolute Outlet Pressure (psia)	DP_{cr} = Critical Pressure Drop
W = Saturated Steam Flow (lbs/hr)	x_T = Critical Pressure Drop Ratio for Air
T₁ = Steam Inlet Temperature (°R) (see table)	x_{cr} = Critical Pressure Drop Ratio for Steam
Z₁ = Steam Compressibility Factor (see table)	= $DP_{cr} / P_1 = F_g x_T = 0.93 x_T$

For Sub-critical Flow

$$Cv = \frac{W}{82 P_1 (1 - x/3 x_{cr}) \sqrt{x/(T_1 Z_1)}}$$

When $DP/P_1 < x_{cr}$: $x = DP/P_1$

For Critical Flow

$$Cv = \frac{W}{54.6 P_1 \sqrt{x_{cr}/(T_1 Z_1)}}$$

When $DP/P_1 \geq x_{cr}$

For single-ported globe valve with flow-to-open seating arrangement:

$$x_T = 0.72 \quad x_{cr} = 0.93 x_T = 0.67$$

$$Cv = \frac{W}{82 P_1 (1 - x/2) \sqrt{x/(T_1 Z_1)}}$$

When $DP/P_1 < 0.67$

$$Cv = \frac{W}{54.6 P_1 \sqrt{0.67/(T_1 Z_1)}}$$

When $DP/P_1 \geq 0.67$

Example: Determine the Cv Value for a Control Valve with 60 psig Inlet Steam Pressure, and 30 psig Outlet Pressure with a Flow Rate of 4,000 lbs/hr.

W = 4,000 lbs/hr
P₁ = 60 psig = 74.7 psia
P₂ = 30 psig = 44.7 psia
DP = 30 psi
x = $DP/P_1 = 30/74.4 = 0.40$
x_{cr} =
 $0.93 x_T = 0.93 \times 0.72 = 0.67$
 Since $x < x_{cr}$ flow is sub-critical
T₁ = 767 (from table)

$$Cv = \frac{W}{82 P_1 (1 - x/2) \sqrt{x/(T_1 Z_1)}}$$

When $DP/P_1 < 0.67$

$$Cv = \frac{4,000}{82 (74.7) (1 - 0.4/2) \sqrt{0.4/(767 \times 0.955)}}$$

$$= \frac{4,000}{114.6} = 35$$

STEAM PROPERTIES & FLOW CHARACTERISTICS

STEAM CAPACITY TABLES

This chart provides a simple method for sizing steam pipes with velocities in the range of 7,000 to 10,000 ft/min.
(Example: a 1" pipe with 100 PSIG steam pressure has a flow rate of 672 lbs/hr at a velocity of 7250 ft/min.)

STEAM PROPERTIES & FLOW CHARACTERISTICS

SIZING STEAM PIPES • Steam Velocity Chart (Schedule 40 pipe)

Saturated steam lines should be sized for a steam velocity of 4800 to 7200 ft/min.

Piping on pressure reducing stations should be sized for the same steam velocity on both sides of the regulator. This usually results in having a regulator smaller than the piping and having larger piping on the downstream side of the regulator.

Example using Steam Velocity Chart:

100 PSIG Inlet Pressure to control valve; 25 PSIG Outlet Pressure; 1,000 lbs/hr flow rate; Determine pipe size required.

Upstream Piping:

Enter Velocity Chart at **A** 1000 lbs/hr. Follow line to **B** 100 PSIG Inlet Pressure. Follow line vertically upwards to **C** 1 1/2" Pipe Diameter. Steam Velocity at **D** shows 4800 ft/min.

Downstream Piping:

Enter Velocity Chart at **A** 1000 lbs/hr. Follow line to **E** 25 PSIG Outlet Pressure. Follow line vertically upwards to **F** 2 1/2" Pipe Diameter. Steam Velocity at **G** shows 5500 ft/min.

STEAM PROPERTIES & FLOW CHARACTERISTICS

SIZING OF CONDENSATE RETURN LINE, FLASH TANK DIAMETER & VENT LINE

- Velocity of Flash Steam in Condensate Return Lines should be between 4000 and 6000 ft/min.
- Velocity in Flash Tank should be less than 600 ft/min.
- Velocity in a Vent Pipe should be less than 4000 ft/min.

Example: A steam trap with a 150 PSIG steam inlet pressure is being discharged into a flash tank operating at 20 PSIG. The condensate load on the trap is 3200 lbs/hr.

Problem:

- (1) Determine the size of the condensate return line from the trap to the flash tank based on velocities of 4,000 - 6,000 ft/min.
- (2) Determine the diameter of the flash tank based on velocities less than 600 ft/min.
- (3) Determine the size of the vent line on the flash tank based on velocities less than 4000 ft/min.

Solution:

The accepted practice of determining condensate return pipe sizing is to base the size of the return pipe on the amount of flash steam in the return line. This is due to the fact that the volume of flash steam is over 1,000 times greater than the equivalent volume of liquid condensate. Therefore, the flash steam is the dominant factor affecting flow in the return line. We must first calculate the amount of flash steam produced.

From the **Percent Flash Steam Table** we find that 11.8% of the condensate will flash into steam. Therefore $.118 \times 3200 = 377$ lbs/hr of flash steam will be produced in the condensate return line and flash tank.

Enter **Condensate Line, Flash Tank & Vent Line Sizing** chart at **A 377 lbs/hr**.

Move horizontally to point **B** 20 PSIG Flash Tank Pressure.

Move vertically upwards to point **D** to determine a **5" Flash Tank Diameter** is needed to keep velocities less than 600 ft/min.

Continue to move vertically to point **E** to determine that the Vent Line on the Flash Tank should be **2" Diameter** in order to keep velocities less than 4,000 ft/min.

Continue to move vertically to point **G** to determine that the **Condensate Line should be 1 1/2" Diameter** in order to maintain condensate return line velocities between 4000 and 6000 ft/min.

PERCENT (%) FLASH STEAM TABLE

Note: For welding end valves only.

(1) Flanged end ratings terminate at 1000°F.

Footnotes:

a) Permissible, but not recommended for prolonged usage above about 800°F.

b) Permissible, but not recommended for prolonged usage above about 850°F.

d) Not to be used over 650°F.

e) Not to be used over 700°F.

f) Not to be used over 800°F.

g) Not to be used over 850°F.

h) Not to be used over 1000°F.

i) Not to be used over 1050°F.

j) Not to be used over 1100°F.

STEAM TRAP APPLICATIONS

INTRODUCTION TO STEAM TRAPS

WHAT IS A STEAM TRAP AND WHAT DOES IT DO?

A steam trap is an automatic valve that allows condensate, air and other non-condensable gases to be discharged from the steam system while holding or trapping the steam in the system. Several different types of steam trap technologies exist to accomplish this extremely critical and necessary task.

WHY ARE STEAM TRAPS REQUIRED?

For any steam system to operate properly the condensate, air and other non-condensable gases such as carbon dioxide must be removed from the steam system. This is the purpose of the steam trap.

CONDENSATE:

When steam releases its heat energy, the steam reverts back to water. This occurs in a heat exchanger making hot water, in a radiator heating a room, or in a steam pipe transferring steam. This water, technically referred to as *condensate*, must be removed from the system or the system would back up with water. The removal of condensate from the steam system is considered the primary function of the steam trap.

AIR:

Air exists in all steam pipes prior to system start-up when the system is cold. This air must be bled out of the piping system so that the steam can enter and eventually reach the designated process applications. If the air is not removed, the steam will effectively be blocked from entering the steam pipes by the residual air. In addition to blocking the steam, air acts as an insulator to heat transfer. Even after the system is filled with steam, small amounts of air can re-enter the system through various paths such as boiler water make-up systems, vacuum breakers and air vents.

NON-CONDENSABLE GASES:

Gases other than air such as carbon dioxide exist inside steam systems. These non-condensable gases must also be separated from the steam and removed from the system for all processes to operate properly. In addition to inhibiting steam flow and proper heat transfer, carbon dioxide can be very corrosive to components in the system.

STEAM TRAP GENERAL APPLICATION CATEGORIES:

DRIP APPLICATIONS:

Drip applications are by far the most common application for steam traps. This application refers to removing the condensate that forms in steam lines when steam loses its heat energy due to radiation losses. Traps used in these applications are referred to as *drip traps*. Generally speaking, traps used for these applications require relatively small condensate capacities and don't normally need to discharge large amounts of air. (Air removal is the primary function of air vents and process traps located throughout the system.) The most common trap choices for drip applications are *thermodynamic* for steam pressures over 30 PSIG, and *float & thermostatic* for pressures up to 30 PSIG. Inverted bucket traps are also commonly used for drip trap applications due to their ability to handle large amounts of dirt and scale often found in this type of application.

PROCESS APPLICATIONS:

Process trap applications refer to removing condensate and air directly from a specific heat transfer process such as a heat exchanger that could be making hot water or a radiator heating a room. Traps used in these applications are referred to as *process traps*. Generally speaking, traps used for process applications require larger condensate handling capability and also need to be able to discharge large amounts of air. The most common trap choices for process applications are *float & thermostatic* traps and *thermostatic* traps. Both are known for their excellent condensate and air handling capabilities. In contrast, thermodynamic traps and inverted bucket traps, which have poor air handling ability, would normally make a poor choice for process applications.

TRACING APPLICATIONS:

Steam tracing refers to using steam to indirectly elevate the temperature of a product using jacketed pipes or tubing filled with steam. A typical application would be wrapping a pipeline containing high viscosity oil with tracing tubing. The steam inside the tubing heats the oil to lower its viscosity, allowing it to flow easily through the pipeline. Similar to any steam applications, a steam trap must be used on the end of the steam tubing to discharge unwanted condensate. Steam traps used in these applications are referred to as *tracing traps*. The most common trap choice for tracing applications is the *thermostatic* type.

STEAM TRAP APPLICATIONS

INTRODUCTION TO STEAM TRAPS

The **Thermodynamic Disc Trap** is simple and compact and an excellent choice for a wide variety of drip applications. They excel in drip applications of pressures ranging from 30 psig to high pressure applications exceeding 3,000 psig, including superheated steam. The ½" TD600L is suitable for most drip applications, and offers reduced size discharge orifice holes which are preferable in terms of performance, longevity, and efficiency.

The design of modern **Thermostatic Bellows Traps** allows these traps to be used on a wide variety of applications, from general service drips to small-to-medium process heating applications with relatively constant loads. The welded stainless steel bellows is extremely rugged which prevents failure from waterhammer and corrosion, making these traps suitable for demanding industrial service. Also, because thermostatic traps subcool condensate, the condensate discharged generates less flash steam which may be advantageous in certain installations. For these reasons, Thermostatic Bellows Traps can be considered as a primary selection or as an alternative to other styles.

The **Float & Thermostatic Trap** is the primary choice of steam trap for process applications. They are excellent at discharging air from the system during start-up and offer a wide range of capacities to accommodate the vast majority of process heating applications. Their design allows them to immediately respond to changing condensate loads and pressures, which is a typical requirement of continuous heating process applications where control valves are used to modulate steam flow. Available F&T models range from designs for low pressure

heating to high-pressure and capacity industrial applications requiring cast steel or stainless steel.

STEAM TRAP APPLICATIONS

DRIP LEG DESIGN

PURPOSE:

Drip Legs are used for removing condensate from steam transmission and distribution lines. This helps ensure high quality steam for use in various plant applications and also will prevent damaging and dangerous waterhammer.

OPERATION:

As steam travels at high velocity through piping, condensate forms as the result of piping heat losses and/or improper boiler control resulting in condensate carryover. Drip legs are therefore located at points where condensate may accumulate to allow for drainage by gravity down to a steam trap for proper discharge from the system. Since condensate drains by gravity, drip legs must be located on the bottom of piping and designed with diameters large enough to promote collection.

INSTALLATION GUIDELINES:

(see Figure 1)

- For drainage of steam transmission and distribution lines, drip legs should be located at bends in piping (direction changes), low points, end of line, and in straight run of piping every 200 feet.
- For protection of equipment such as regulators and control valves, drip legs should be installed directly ahead of the regulating or control valve line.
- Proper steam trap selection for drip applications is dependent upon application requirements, such as pressure, number of and distance between installed steam traps, ambient conditions, start-up requirements, etc. A commonly accepted practice is to use float & thermostatic (F&T) steam traps for low pressure steam systems up to 30 PSIG, and thermodynamic steam traps for steam pressures over 30 PSIG.
- Because condensate drainage from steam systems is dependent upon gravity, drip leg diameter is critical for optimum removal – larger is better. Collection leg diameter (D_L) is recommended to be the same size as the steam main (D), up to 4". For steam mains above 4", the collection leg diameter may be half the diameter of the main, but not less than 4". The length (L) of the drip leg for systems with automatic start-up should be a minimum of 28" to provide approximately 1 PSI head pressure. The length (L) of the drip leg for systems with supervised start-up should be $1.5 \times D_L$, but not less than 8".
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- A drain valve is included at the bottom of the collection leg for manual discharge of condensate during supervised start-up. The drain valve should be located at least 6" below the steam trap line.
- An isolation valve and strainer should be installed before the steam trap. The isolation valve simplifies maintenance of the trap and the strainer protects the trap from any dirt, debris or scale in the line.

STEAM TRAP APPLICATIONS

DRIP LEG DESIGN

Figure 1: Proper DRIP LEG Designs

DRIP LEG DESIGN CRITERIA:

- 1) Locate prior to valves, bends in pipe (direction changes), low points, end of line and straight piping runs (max. 200 ft. apart).
- 2) Diameter:
 - Drip leg diameter (D_L) to be equal to steam main diameter (D) for steam main sizes up to 4"
 - Drip leg diameter (D_L) may be half the steam main diameter (D) for steam main sizes over 4", but not less than 4"
- 3) Length (L):
 - For systems with automatic start-up, L to be 28" minimum (= 1 PSI minimum head pressure)
 - For systems with supervised start-up, L to be $1.5 \times D_L$, but not less than 8"

DRIP LEG Before Regulator or Control Valve

DRIP LEG Draining Steam Main

STEAM TRAP APPLICATIONS

PROCESS TRAP GUIDELINES – Gravity Drainage

PURPOSE:

For removing condensate from below steam heat transfer equipment to ensure optimum heating under various load conditions.

OPERATION:

Steam used to heat product such as water in a heat exchanger condenses to liquid after passing through the heat exchanger and releasing its heating energy. To ensure optimum heating, this condensate is removed through an adequately sized drip leg and steam trap properly selected for the application and installed below the equipment. A Float and Thermostatic (F&T) steam trap is often an appropriate choice due to its modulating discharge and air venting capability.

INSTALLATION GUIDELINES:

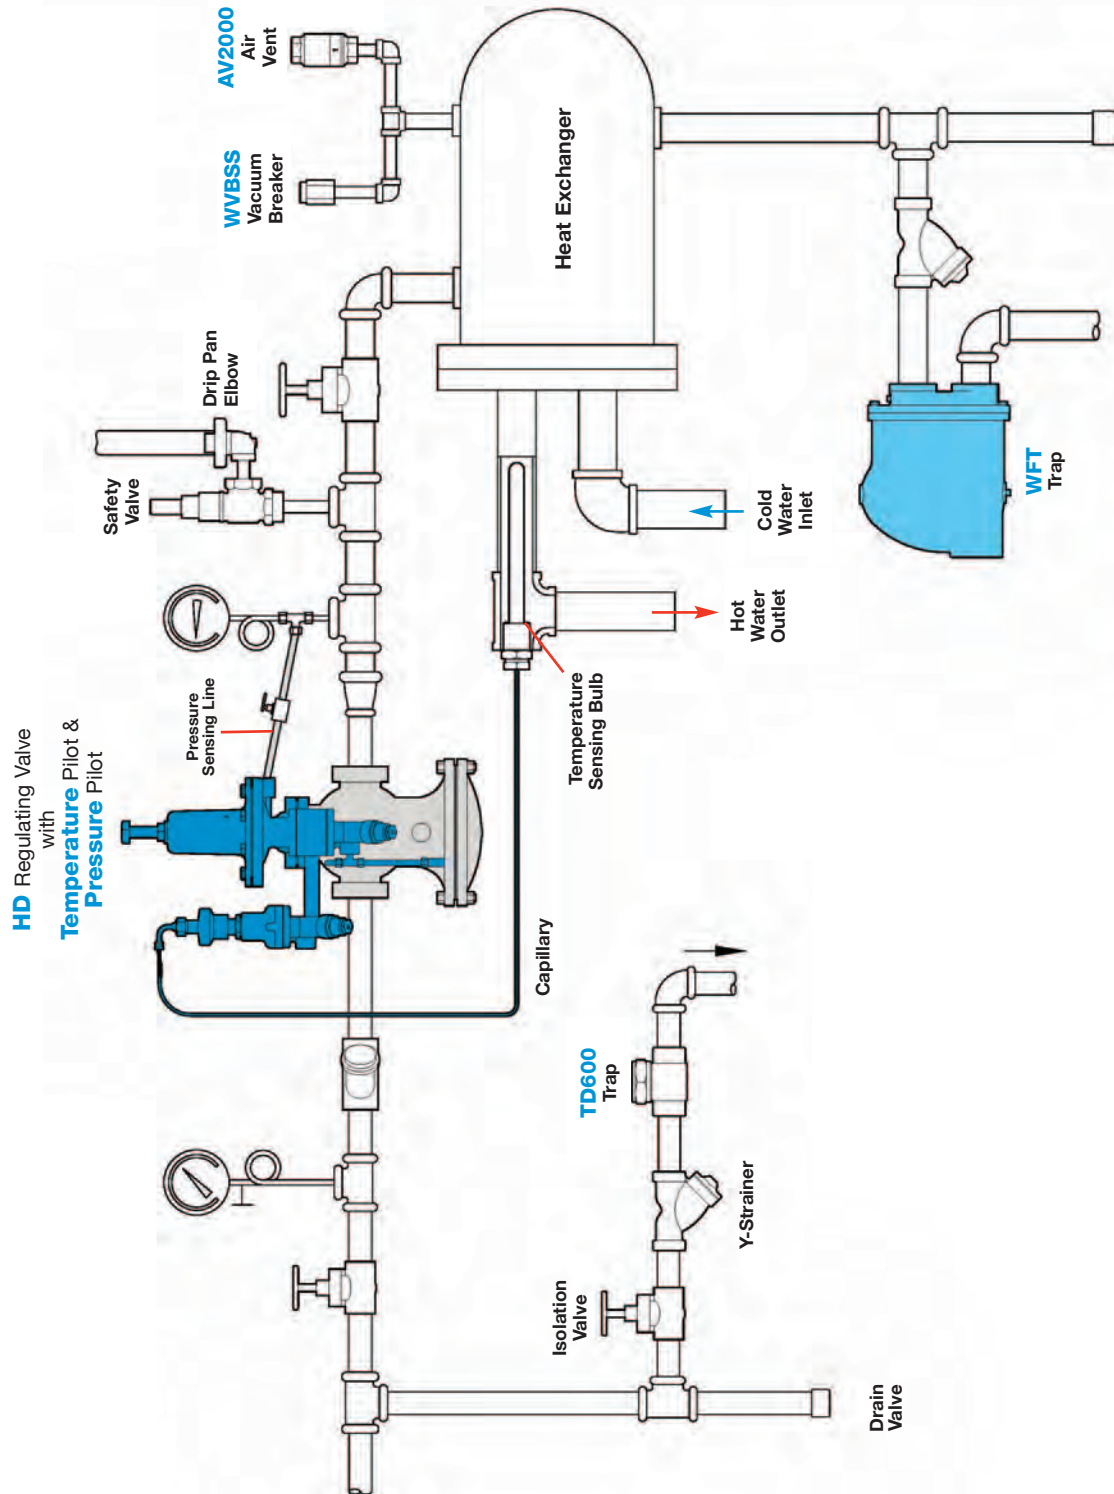

(see Figure 2)

- Selection and sizing of the process steam trap is critical to proper operation. A safety load factor (SLF) is applied to accommodate load variations, as well as high start-up requirements. Consult appropriate sections of this catalog or the factory for guidelines regarding proper process steam trap selection and sizing.
- The collecting leg to the process trap should be no smaller than the designed condensate outlet of the heat transfer equipment. Note that some steam trap technologies such as thermostatic require extended distance between the heat exchanger and steam trap to allow for back-up of subcooled condensate.
- The process trap should be located 2.3 feet (28") below the condensate outlet of the heat exchanger to provide a minimum of 1 PSI head pressure.
- The drip leg and steam trap prior to the regulating valve protect the valve from condensate, as well as ensure the best quality steam for heat transfer. Note the take-off from the top of the steam main to avoid condensate that would collect on the bottom of the main piping.
- The vacuum breaker and auxiliary air vent located at the top of the heat exchanger vessel promotes proper drainage and optimum heat transfer. The vacuum breaker allows system equalization with atmospheric air to allow gravity condensate drainage when vacuum is formed from condensing steam. The air vent improves heat-up times and overall heat transfer by expelling accumulated air on start-up.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- An isolation valve and strainer should be installed before any steam trap. The isolation valve simplifies maintenance of the trap and the strainer protects the trap from any dirt, debris or scale in the line.

STEAM TRAP APPLICATIONS

PROCESS TRAP GUIDELINES – Gravity Drainage

Figure 2:

Shell & Tube Heat Exchanger with Gravity Drainage of Condensate

STEAM TRAP APPLICATIONS

PROCESS TRAP GUIDELINES – Syphon Drainage

PURPOSE:

For removing condensate from steam heat transfer equipment when the steam trap is to be installed *above* the point where condensate will collect.

OPERATION:

When steam is used to heat liquid in a tank with a submerged coil or a rotary drum dryer, gravity drainage to the steam trap is not possible. For these applications, it is necessary to install the steam trap above the drain point of the equipment by creating a syphon lift to allow for proper condensate drainage.

INSTALLATION GUIDELINES:

(see Figure 3)

- There are two critical requirements to ensure proper operation of syphon lift process drainage systems: A water seal lift fitting and a steam trap with a function to prevent steam lock (often referred to as Steam Lock Release or SLR).
- The lift fitting on a submerged coil provides a water seal to stop steam from pushing past the condensate and reaching the steam trap, preventing a vapor-lock condition of the trap.
- Steam Lock Release (SLR) is provided on the steam trap to ensure the syphon lift remains continuous by preventing steam from becoming trapped – or locked – between the cavity of the steam trap and incoming condensate. The SLR function allows any small portion of trapped steam to be automatically removed from the system, allowing continuous drainage.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- An isolation valve and strainer should be installed before any steam trap. The isolation valve simplifies maintenance of the trap and the strainer protects the trap from any dirt, debris or scale in the line.

Figure 3: SUBMERGED COIL FOR HEATING LIQUID

Steam Lock Release Mechanism

must be used when trap is positioned above condensate level.

STEAM TRAP APPLICATIONS

PROCESS TRAP GUIDELINES – Syphon Drainage

ROTATING STEAM DRYER

Commonly found in the Paper Making industry, a rotating piece of equipment offers a unique challenge of removing the condensate. Steam inside a rotating drum cylinder is used to heat product such as sheets of paper over the outside surface of the drum. The steam pressure pushes the condensate up through the pipe to the steam trap. Since the pipe that the condensate is traveling through is surrounded by steam, an issue can develop that will “**Steam Lock**” the trap causing the trap to stay closed, allowing the condensate to build up inside the rotating drum (Figure 4). By placing a **Steam Lock Release** feature on the Steam Trap, a small amount of steam will be constantly discharged through the trap. This allows condensate to reach the steam trap which causes it to open and function properly. This steam lock release feature is available on ALL F&T and Thermostatic traps and should be considered on this type of application.

Figure 4: Rotating Steam Dryer Illustrating “Steam Lock”

Steam Lock Release Option

must be used when trap is positioned above condensate level.

REGULATING VALVE APPLICATIONS

Regulator Application & Installation Notes

The following are considerations for all steam regulator installations, as system operation is dependent upon proper design, installation, start-up and maintenance procedures:

Inlet & Outlet Pipe Sizing

Improperly sized piping can contribute to excessive noise in a steam system. Make certain inlet and outlet piping to the regulator is adequately sized for the flow, velocity and pressure requirements.

Inlet piping can be 1-2 sizes larger and outlet piping 2-3 sizes larger than the connection ports of a properly sized regulator.

Straight Run of Pipe Before and After the Valve

Pipe fittings, bends and other accessories contribute to fluid turbulence in a system which can result in erratic control. To limit this and ensure optimum system operation, follow recommended guidelines for minimum straight run lengths of pipe before and after a regulator.

Note: Any isolation valves or pipeline accessories should be full-ported.

Reducer Selection

Concentric pipe reducers should be avoided on the inlet side of regulators as they can allow entrained condensate to collect, potentially leading to damaging and dangerous waterhammer. Therefore, when reducers are required in the steam piping to accommodate properly sized valves and pipes, use eccentric reducers on regulator inlets and concentric or eccentric reducers on regulator outlets.

Concentric Reducer

Eccentric Reducer

REGULATING VALVE APPLICATIONS

General Installation Guidelines

Strainers with Blowdown Valves

Regardless of any filters provided on a regulator, a strainer with blowdown valve is recommended before (upstream of) all regulator installations. Pipeline debris and scale can damage internal valve components, potentially leading to poor operation and/or failure.

Note: Consider strainer orientation to avoid collection of condensate (see diagram).

Drip Legs & Steam Traps

To prevent condensate accumulated during shutdown from possibly damaging the regulator or piping at start-up, an adequately sized drip leg with steam trap should be installed prior to all regulators. This will also help protect the regulator during normal operation.

Note: Separators may be necessary when boiler carryover or “wet” steam is a concern.

Proper Start-up & Maintenance Procedures

It is important to follow good start-up practices to avoid operational complications and potential system damage. Starting a steam system too quickly or using an improper sequence may lead to a potentially hazardous working environment. Lack of system maintenance over time can also contribute to this situation.

It is imperative to develop proper start-up and maintenance procedures and train personnel on the importance of following them at all times.

Consult equipment manufacturers for specific guidelines, if necessary.

REGULATING VALVE APPLICATIONS

PRESSURE REDUCING STATION • Using Spring-Loaded Pilot

PURPOSE:

For reducing system inlet pressure to a constant outlet pressure.

OPERATION:

The pressure reducing valve (PRV) can be easily adjusted to set the desired outlet pressure and modulates to maintain that pressure setting. The PRV requires no external power source.

INSTALLATION GUIDELINES:

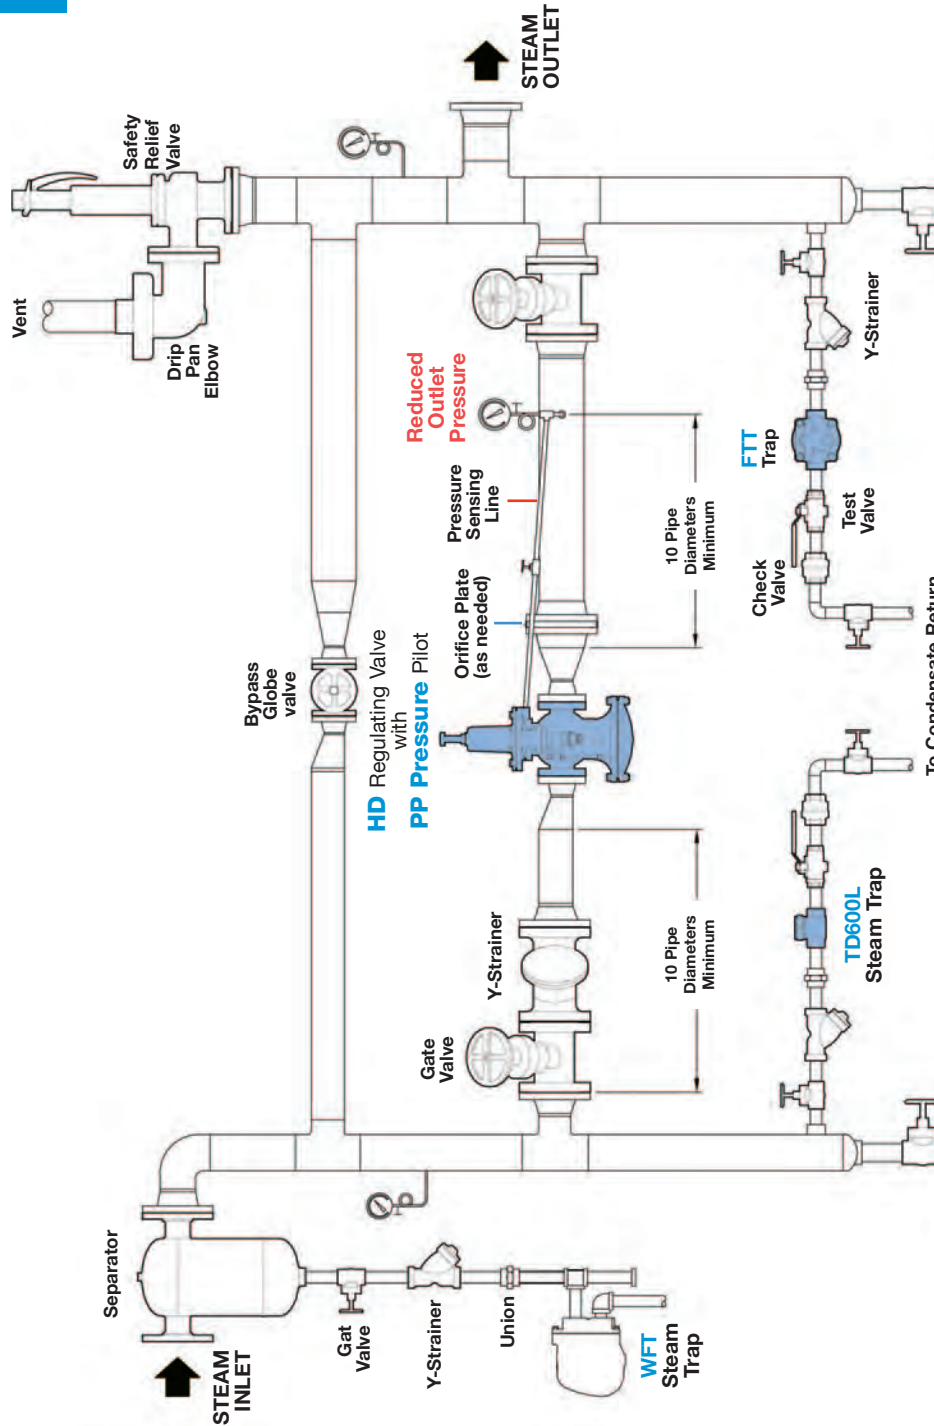

(see Figure 5)

- This example depicts a pilot-operated steam PRV, whereby an external sensing line is required to sense downstream pressure. The end of the sensing line is placed away from the turbulent flow of the valve outlet. This helps to improve accuracy of the set pressure. Set pressure is adjusted by turning a screw on the pilot to increase or decrease compression on a balancing spring.
- For optimum operation and service life, maintain recommended minimum piping straight runs before and after the PRV. Inlet pipe diameters could be 1-2 sizes larger and outlet pipe diameters 2-3 sizes larger than the end connections of an appropriately sized PRV. The purpose of increasing the pipe size downstream of the regulator is to keep the steam velocity constant on both sides of the regulator.
- The pressure sensing line should slope downwards, away from the regulator, to prevent condensate from entering the pilot.
- Eccentric reducers, if required, are used on valve inlets to prevent accumulation of condensate which could become entrained with high-velocity steam, possibly resulting in dangerous waterhammer.
- While the separator shown upstream is appropriate for protection of the PRV, it is not always required as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be "wet" and the entrained moisture could affect valve performance and/or result in component damage.
- Consider installing a properly sized bypass line with globe valve to provide continuous operation should regulator maintenance be required.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- A safety relief valve (SRV) is appropriate where applicable codes dictate their requirement, or anywhere protection of downstream piping and equipment from over-pressurization is desired. The SRV needs to handle the complete volume of steam from the regulator and bypass loop. Consult the factory for appropriate SRV sizing guidelines.
- Orifice plates help reduce pipeline noise and are available as needed. Series OP orifice plates are custom engineered to maximize noise attenuation and reduce dbA to the lowest achievable value. The number and diameter of holes will be determined based on application conditions, and the plate diameter will typically be equal to the recommended downstream pipe size. The regulator(s) must be sized in conjunction with the orifice plate. For PRV and orifice plate sizing, consult the factory or SteamWorx sizing program on www.watsonmcdaniel.com.

REGULATING VALVE APPLICATIONS

PRESSURE REDUCING STATION • Using Spring-Loaded Pilot

Figure 5:

SINGLE STAGE Pressure Reducing Station using Spring-loaded Pilot
(HD Regulator Applications)

REGULATING VALVE APPLICATIONS

PRESSURE REDUCING STATION • Using Spring-Loaded Pilot and Trip-Stop Valve

PURPOSE:

For system protection after pressure reducing valves when applicable codes allow for installation of a Trip-Stop valve in lieu of a Safety Relief Valve (SRV) to prevent over-pressurization. Consult factory for allowable use.

OPERATION:

The Trip-Stop pilot is installed on a separate HD Series main valve downstream of the pressure reducing valve. If the downstream control pressure increases above the factory-set pressure on the Trip-Stop pilot, the pilot trips to release the diaphragm pressure on the main valve, closing the valve to stop steam flow. Once the pressure downstream is below the set point, the pilot may be manually reset.

INSTALLATION GUIDELINES:

(see Figure 6)

- This example depicts a pilot-operated steam PRV with a separate trip-stop valve, whereby an external sensing line is required to sense downstream pressure. The end of the sensing line is placed away from the turbulent flow the trip-stop valve outlet. This helps to improve accuracy of the set pressure. Set pressure is adjusted by turning a screw on the PP pressure pilot to increase or decrease compression on a balancing spring.
- The trip-stop main valve should be sized and selected to provide minimal pressure drop and to allow full steam flow downstream of the main PRV. A low-differential or low-pressure main valve is typically required for the trip-stop valve. Consult factory for appropriate sizing guidelines.
- For optimum operation and service life, maintain recommended minimum piping straight runs before and after the PRV. Inlet pipe diameters could be 1-2 sizes larger and outlet pipe diameters 2-3 sizes larger than the end connections of an appropriately sized PRV. The purpose of increasing the pipe size downstream of the regulator is to keep the steam velocity constant on both sides of the regulator.
- The pressure sensing line should slope downwards, away from the regulator, to prevent condensate from entering the pilot.
- Eccentric reducers, if required, are used on valve inlets to prevent accumulation of condensate which could become entrained with high-velocity steam, possibly resulting in dangerous waterhammer.
- While the separator shown upstream is appropriate for protection of the PRV, it is not always required as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be "wet" and the entrained moisture could affect valve performance and/or result in component damage.
- Consider installing a properly sized bypass line with globe valve to provide continuous operation should regulator maintenance be required.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.

Figure 6:

REGULATING VALVE APPLICATIONS

PRESSURE REDUCING STATION • Using Air-Loaded Pilot

PURPOSE:

For reducing system inlet pressure to a constant outlet pressure when valve is located in a remote location and/or using air pressure for control is desired.

OPERATION:

This combination of HD regulating valve and PA-pilot allows air to be used to control outlet pressure in lieu of the spring of a standard PP-pilot. Using air allows for simple adjustment of control pressure when valve is installed in a remote and/or difficult to access location.

INSTALLATION GUIDELINES:

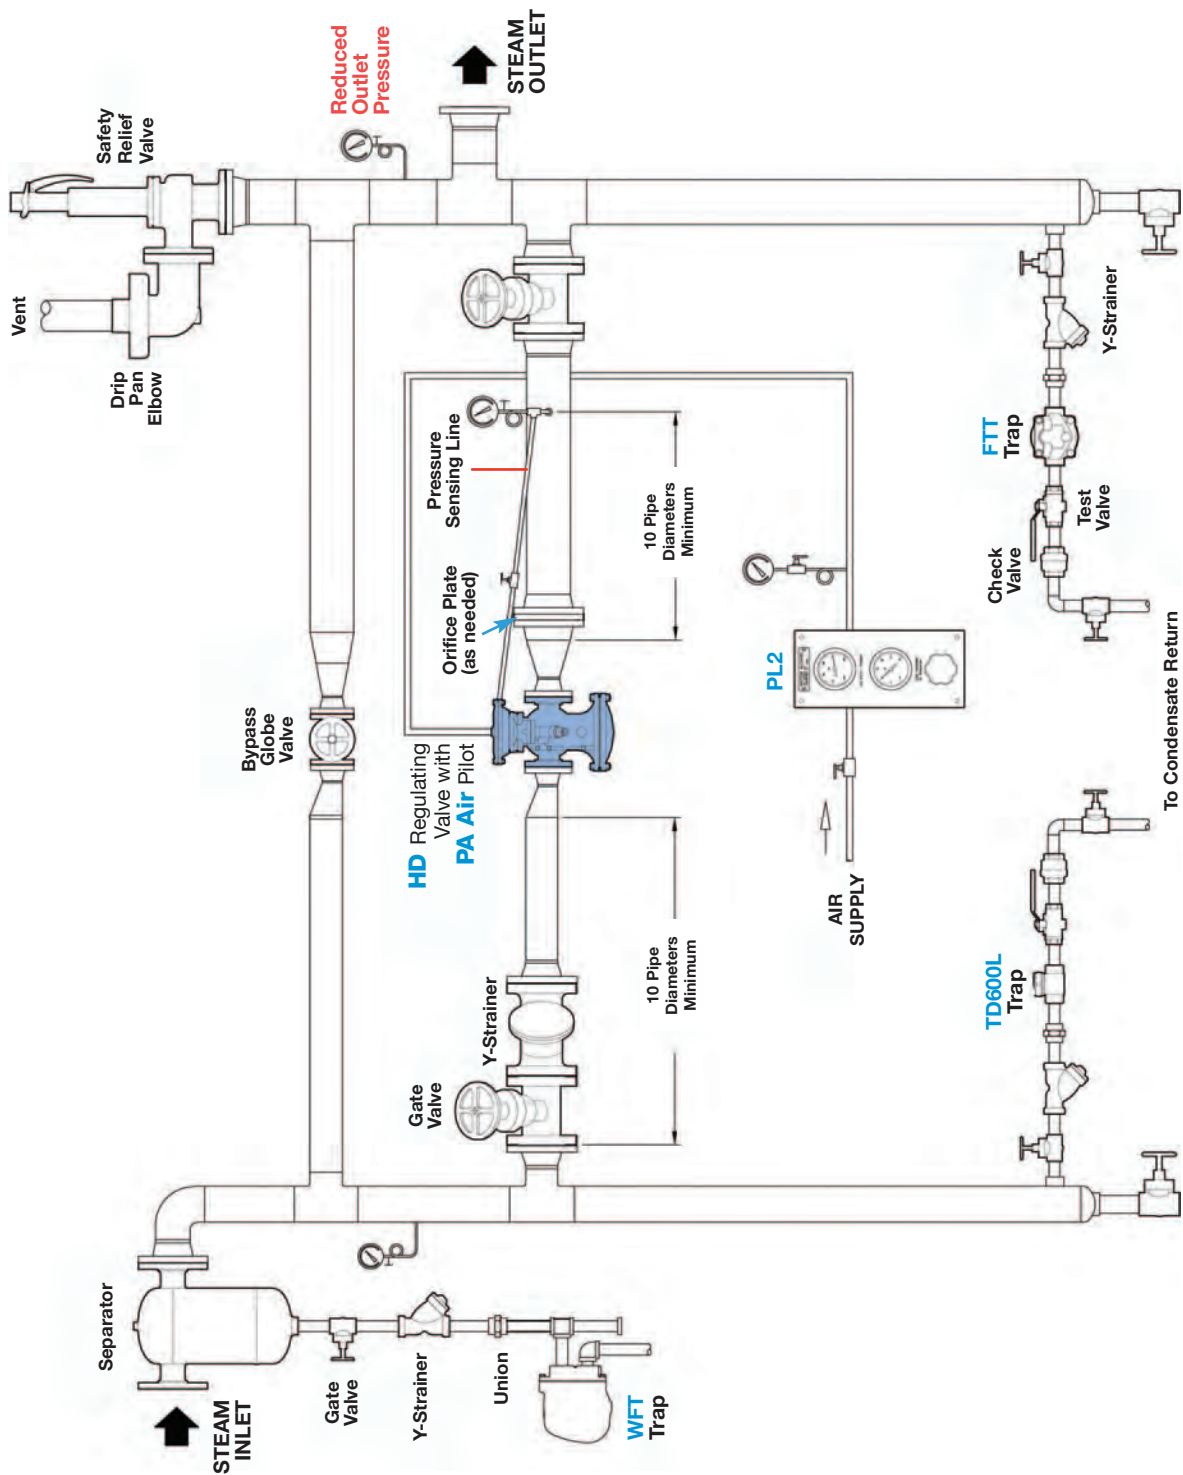

(see Figure 7)

- The desired set outlet pressure will determine the specific PA-Pilot required as well as the air supply pressure to attain the set pressure. Consult the appropriate section of this catalog or the factory for selection guidelines.
- For optimum operation and service life, maintain recommended minimum piping straight runs before and after the PRV. Inlet pipe diameters could be 1-2 sizes larger and outlet pipe diameters 2-3 sizes larger than the end connections of an appropriately sized PRV. The purpose of increasing the pipe size downstream of the regulator is to keep the steam velocity constant on both sides of the regulator.
- The pressure sensing line should slope downwards, away from the regulator, to prevent condensate from entering the pilot.
- Eccentric reducers, if required, are used on valve inlets to prevent accumulation of condensate which could become entrained with high-velocity steam, possibly resulting in dangerous waterhammer.
- While the separator shown upstream is appropriate for protection of the PRV, it is not always required, as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be “wet” and the entrained moisture could affect valve performance and/or result in component damage.
- Consider installing a properly sized bypass line with globe valve to provide continuous operation should regulator maintenance be required.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- A safety relief valve (SRV) is appropriate where applicable codes dictate their requirement, or anywhere protection of downstream piping and equipment from over-pressurization is desired. The SRV needs to handle the complete volume of steam from the regulator and bypass loop. Consult the factory for appropriate SRV sizing guidelines.
- Orifice plates help reduce pipeline noise and are available as needed. Series OP orifice plates are custom engineered to maximize noise attenuation and reduce dbA to the lowest achievable value. The number and diameter of holes will be determined based on application conditions, and the plate diameter will typically be equal to the recommended downstream pipe size. The regulator(s) must be sized in conjunction with the orifice plate. For PRV and orifice plate sizing, consult the factory or SteamWorx sizing program on www.watsonmcdaniel.com.

REGULATING VALVE APPLICATIONS

PRESSURE REDUCING STATION • Using Air-Loaded Pilot

Figure 7:

Pressure Reducing Station with Air-Loaded Pilot for Remote Installations
(HD Regulator Applications)

REGULATING VALVE APPLICATIONS

PRESSURE REDUCING STATION • 2-Stage (Series) for High Pressure Turndown

PURPOSE:

For reducing steam system inlet pressure to a constant outlet pressure when the pressure drop exceeds the recommended operation of a single-stage pressure regulating valve (PRV). This will help reduce overall velocity, resulting in less noise and improved equipment service life.

OPERATION:

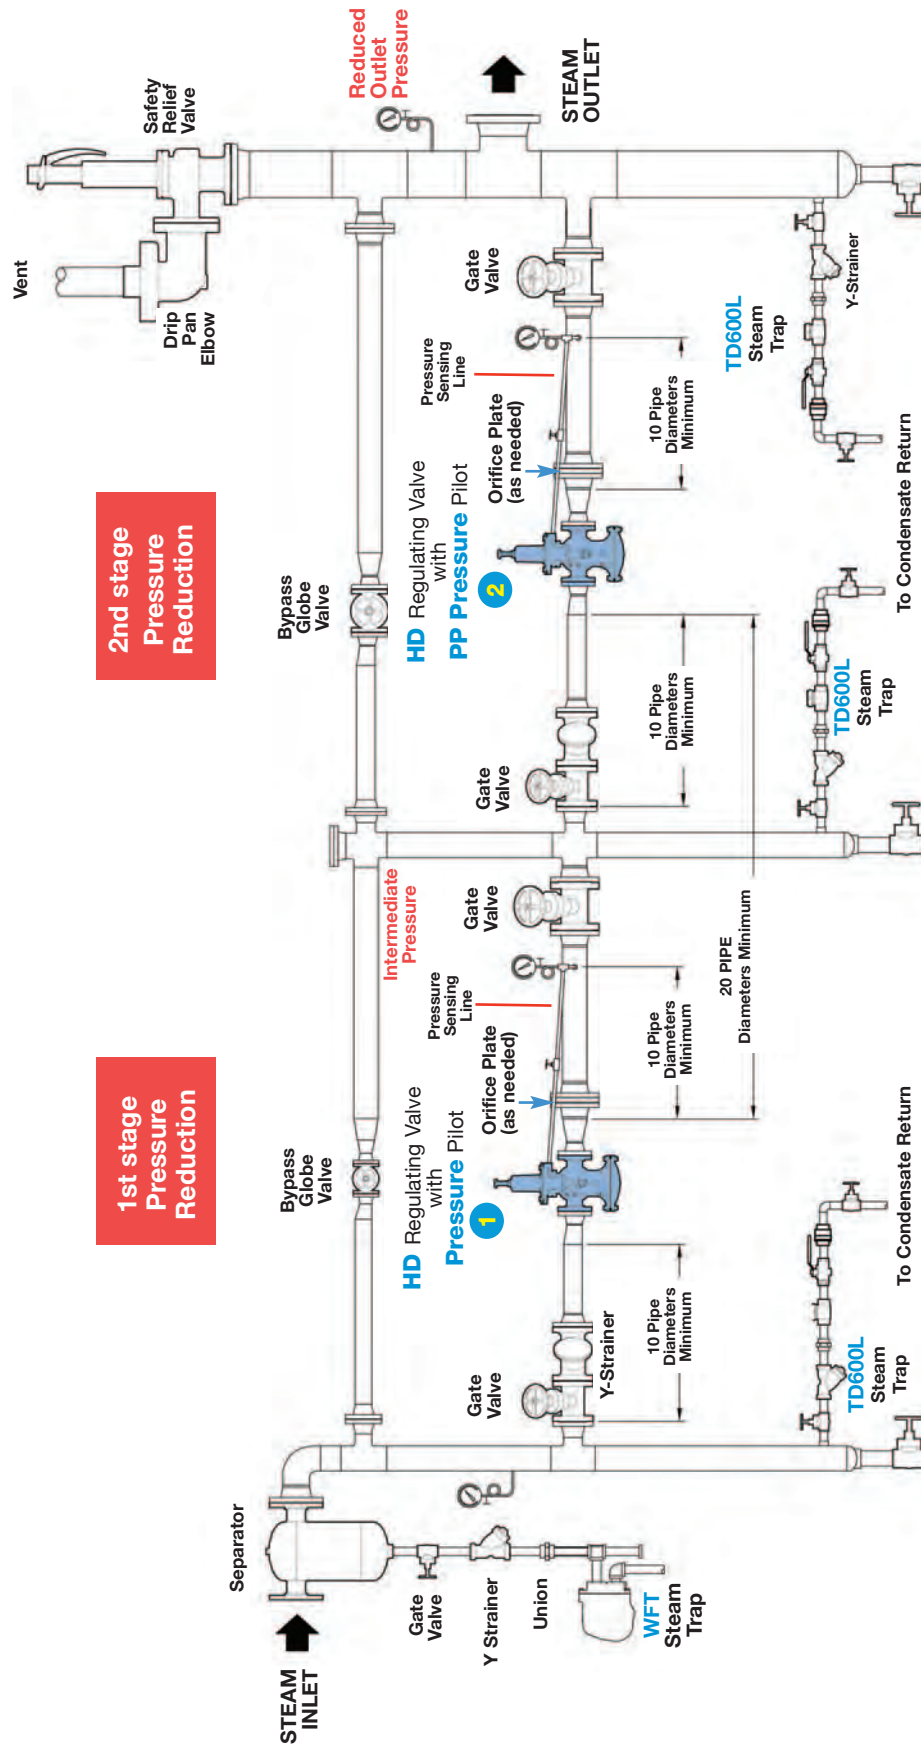

The 1st stage PRV is selected to reduce the initial steam pressure to a reasonable pressure between the initial inlet and desired outlet delivery pressure. This intermediate pressure is typically selected to ensure that each PRV is within recommended turndown guidelines. However, it is also possible there will be a use for steam at a specific intermediate pressure, which must be considered when evaluating turndown and sizing guidelines. The 2nd stage PRV, installed in series with the 1st stage, then reduces pressure to the final outlet delivery pressure. Individual valve setting and operation is the same as for single-stage applications.

INSTALLATION GUIDELINES:

(see Figure 8)

- This example depicts a two-stage (series) pilot-operated steam PRV pressure reducing station using HD Regulators with Pressure Pilot. An external sensing line is required to sense downstream pressure from each regulator. The end of each sensing line is placed away from the turbulent flow at the valve outlet. This helps to improve accuracy of the set pressures. Set pressure for each PRV is adjusted by turning a screw on the pilot to increase or decrease compression on a balancing spring.
- For optimum operation and service life, maintain recommended minimum piping straight runs before and after the PRV. Inlet pipe diameters could be 1-2 sizes larger and outlet pipe diameters 2-3 sizes larger than the end connections of an appropriately sized PRV. The purpose of increasing the pipe size downstream of the regulator is to keep the steam velocity constant on both sides of the regulator.
- Each pressure sensing line should slope downwards, away from the regulator, to prevent condensate from entering the pilot.
- Eccentric reducers, if required, are used on valve inlets to prevent accumulation of condensate which could become entrained with high-velocity steam, possibly resulting in dangerous waterhammer.
- While the separator shown upstream is appropriate for protection of the PRVs, it is not always required, as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be “wet” and the entrained moisture could affect valve performance and/or result in component damage.
- Consider installing a properly sized bypass line with globe valve on each stage, to provide continuous operation should regulator maintenance be required.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- A safety relief valve (SRV) is appropriate where applicable codes dictate their requirement, or anywhere protection of downstream piping and equipment from over-pressurization is desired. The SRV needs to handle the complete volume of steam from the regulator and bypass loop. Consult the factory for appropriate SRV sizing guidelines.
- Orifice plates help reduce pipeline noise and are available as needed. Series OP orifice plates are custom engineered to maximize noise attenuation and reduce dbA to the lowest achievable value. The number and diameter of holes will be determined based on application conditions, and the plate diameter will typically be equal to the recommended downstream pipe size. The regulator(s) must be sized in conjunction with the orifice plate. For PRV and orifice plate sizing, consult the factory or SteamWorx sizing program on www.watsonmcdaniel.com.

Figure 8:

Two-Stage (Series) Pressure Reducing Station
(HD Regulator Applications)

REGULATING VALVE APPLICATIONS

PRESSURE REDUCING STATION • Parallel for High Flow Turndown

PURPOSE:

For reducing steam system inlet pressure to a constant outlet pressure when steam flow rates vary widely. This will help improve system rangeability resulting in more accurate control.

OPERATION:

Because regulators are simple, self-powered devices which do not rely on an external control signal to determine valve steam position, they may not have the flow rangeability of control valves. Therefore, if a system has large flow variations (such as summer and winter loads), multiple regulators should be considered. Typically referred to as a 1/3 - 2/3 system, one valve may be sized for approximately 1/3 of the total maximum load demand and a larger valve for the remaining 2/3. When full load is required, both valves will be open and regulating. The small regulator is typically the primary valve and is set at a pressure 2 psi higher than the larger secondary valve. This allows the small regulator to be the only one flowing when demand is low. When flow increases and the small valve cannot keep up with the demand, the downstream pressure will begin to drop which will allow the larger secondary valve to open in order to help satisfy the demand. Although the smaller regulator is commonly selected as the primary valve, either the smaller or larger regulator may be set as the primary valve based on anticipated load demand requirements. The primary valve should always be set a minimum of 2 psi above the secondary valve.

INSTALLATION GUIDELINES:

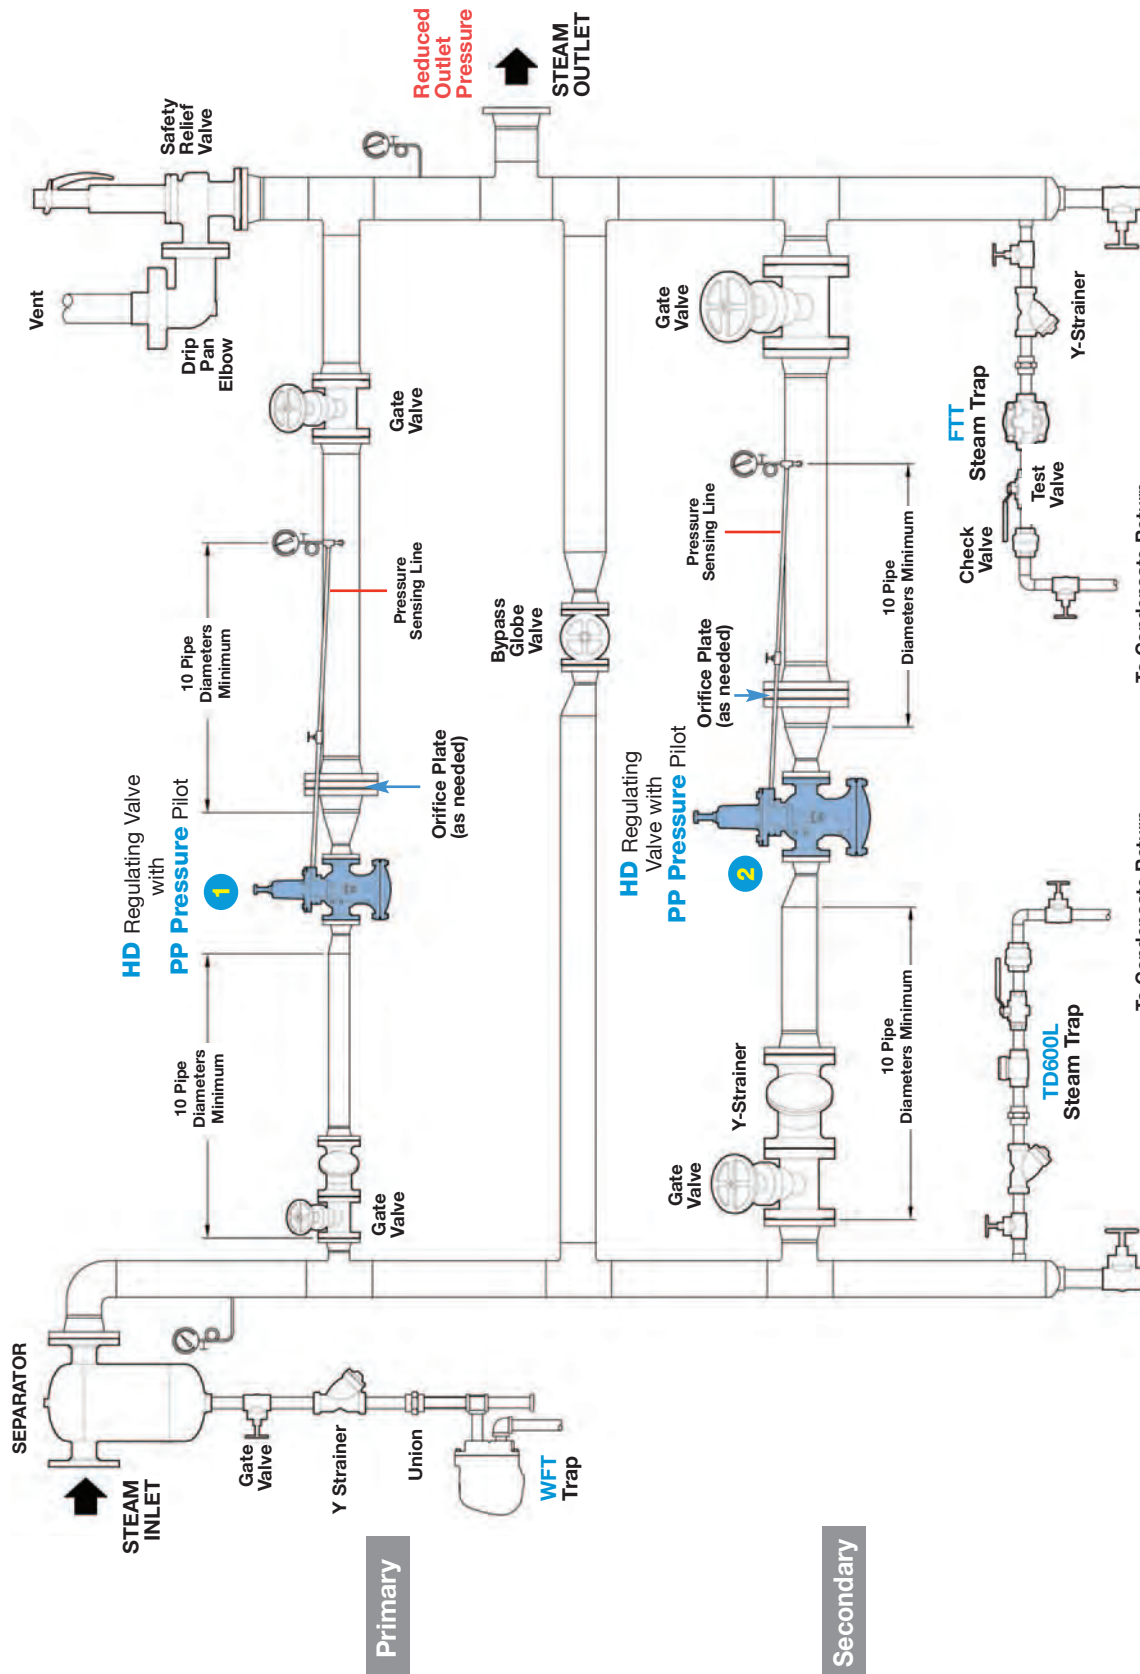

(see Figure 9)

- This example depicts a parallel pilot-operated steam PRV pressure reducing station using HD Regulators with Pressure Pilot. An external sensing line is required to sense downstream pressure from each regulator. The end of each sensing line is placed away from the turbulent flow at the valve outlet. This helps to improve accuracy of the set pressures. Set pressure for each PRV is adjusted by turning a screw on the pilot to increase or decrease compression on a balancing spring.
- Proper setting of the valves is key to proper operation. The chosen primary valve should be set at a pressure approximately 2 PSI higher than that of the secondary valve.
- For optimum operation and service life, maintain recommended minimum piping straight runs before and after the PRV. Inlet pipe diameters could be 1-2 sizes larger and outlet pipe diameters 2-3 sizes larger than the end connections of an appropriately sized PRV. The purpose of increasing the pipe size downstream of the regulator is to keep the steam velocity constant on both sides of the regulator.
- Each pressure sensing line should slope downwards, away from the regulator, to prevent condensate from entering the pilot.
- Eccentric reducers, if required, are used on valve inlets to prevent accumulation of condensate which could become entrained with high-velocity steam, possibly resulting in dangerous waterhammer.
- While the separator shown upstream is appropriate for protection of the PRV, it is not always required, as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be "wet" and the entrained moisture could affect valve performance and/or result in component damage.
- Consider installing a properly sized bypass line with globe valve to provide continuous operation should regulator maintenance be required.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- A safety relief valve (SRV) is appropriate where applicable codes dictate their requirement, or anywhere protection of downstream piping and equipment from over-pressurization is desired. The SRV needs to handle the complete volume of steam from the regulator and bypass loop. Consult the factory for appropriate SRV sizing guidelines.
- Orifice plates help reduce pipeline noise and are available as needed. Series OP orifice plates are custom engineered to maximize noise attenuation and reduce dbA to the lowest achievable value. The number and diameter of holes will be determined based on application conditions, and the plate diameter will typically be equal to the recommended downstream pipe size. The regulator(s) must be sized in conjunction with the orifice plate. For PRV and orifice plate sizing, consult the factory or SteamWorx sizing program on www.watsonmcdaniel.com.

REGULATING VALVE APPLICATIONS

PRESSURE REDUCING STATION • Parallel for High Flow Turndown

Figure 9:

PARALLEL Pressure Reducing Station
(HD Regulator Applications)

REGULATING VALVE APPLICATIONS

PRESSURE REDUCING STATION • Parallel for High Flow Turndown to Deaerator

PURPOSE:

For reducing steam system inlet pressure to a constant outlet pressure when steam flow rates vary widely. This will help improve system rangeability resulting in more accurate control. A parallel configuration is often ideal when supplying steam to a deaerator tank as they commonly experience a wide range of steam flow rates depending on the actual make-up water heating requirements. Consult deaerator manufacturer for accurate and reasonable sizing guidelines.

OPERATION:

Because regulators are simple, self-powered devices which do not rely on an external control signal to determine valve steam position, they may not have the flow rangeability of control valves. Therefore, if an application has large flow variations (such as a deaerator), multiple regulators should be considered to improve operation and control. Typically referred to as a 1/3 - 2/3 system, one valve may be sized for approximately 1/3 of the total maximum load demand and a larger valve for the remaining 2/3. When full load is required, both valves will be open and regulating. The small regulator is typically the primary valve and is set at a pressure 2 psi higher than the larger secondary valve. This allows the small regulator to be the only one flowing when demand is low. When flow increases and the small valve cannot keep up with the demand, the downstream pressure will begin to drop which will allow the larger secondary valve to open in order to help satisfy the demand. Although the smaller regulator is commonly selected as the primary valve, either the smaller or larger regulator may be set as the primary valve based on anticipated load demand requirements. The primary valve should always be set a minimum of 2 psi above the secondary valve.

INSTALLATION GUIDELINES:

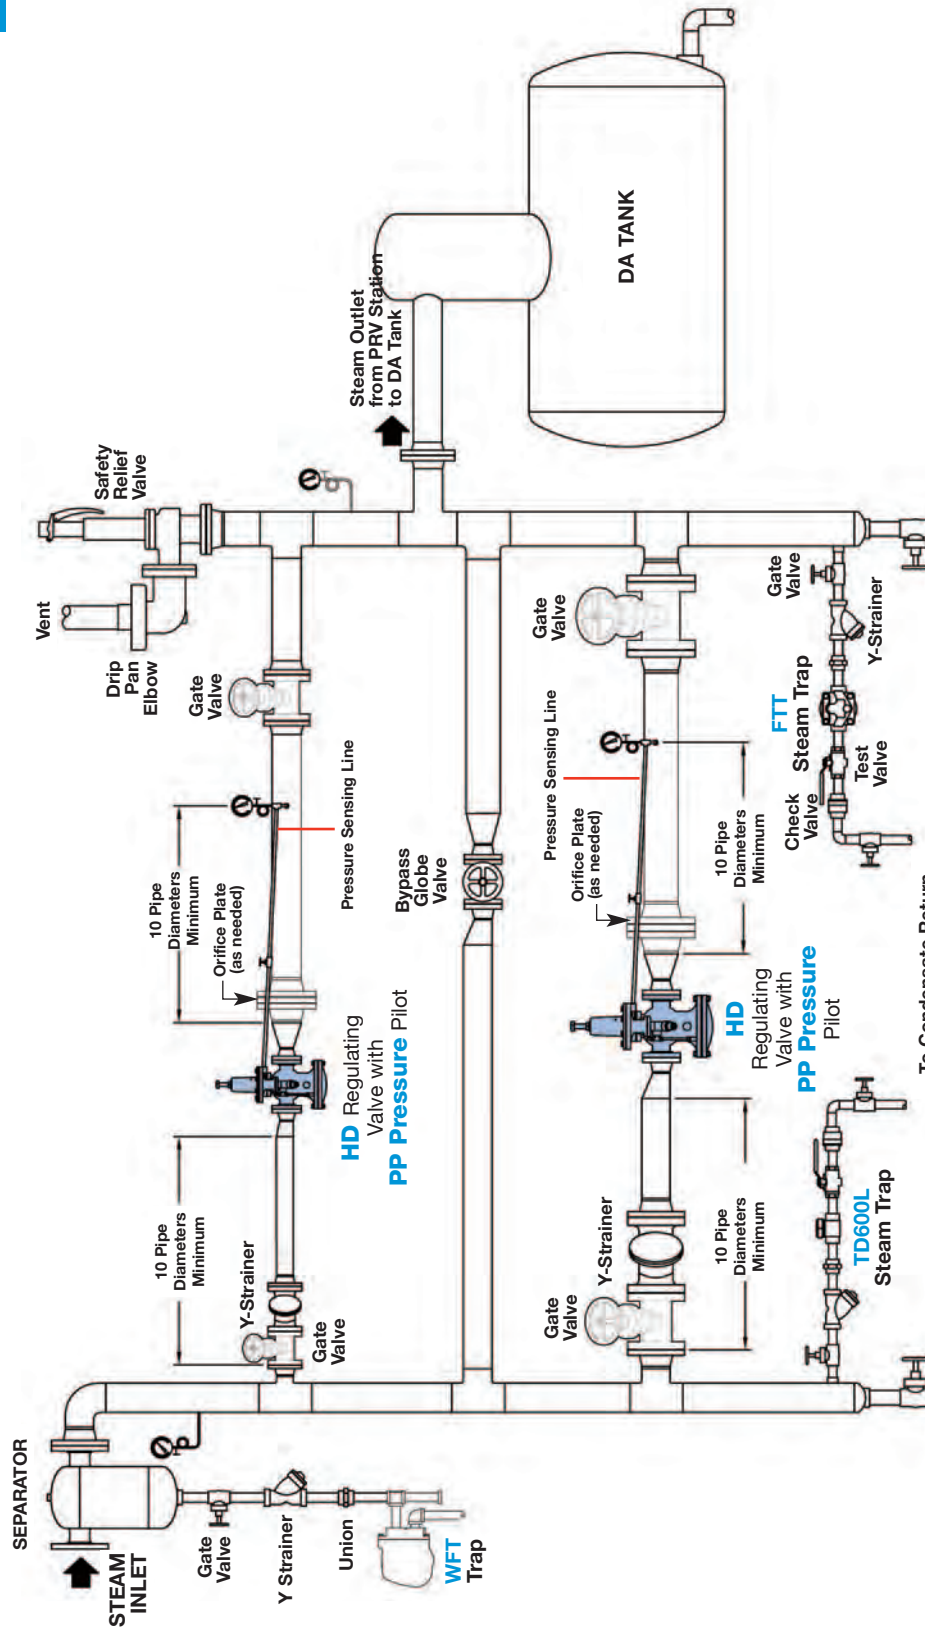

(see Figure 10)

- This example depicts a parallel pilot-operated steam PRV pressure reducing station using HD Regulators with Pressure Pilot. An external sensing line is required to sense downstream pressure from each regulator. The end of each sensing line is placed away from the turbulent flow at the valve outlet. This helps to improve accuracy of the set pressures. Set pressure for each PRV is adjusted by turning a screw on the pilot to increase or decrease compression on a balancing spring.
- Proper setting of the valves is key to proper operation. The chosen primary valve should be set at a pressure approximately 2 PSI higher than that of the secondary valve.
- For optimum operation and service life, maintain recommended minimum piping straight runs before and after the PRV. Inlet pipe diameters could be 1-2 sizes larger and outlet pipe diameters 2-3 sizes larger than the end connections of an appropriately sized PRV. The purpose of increasing the pipe size downstream of the regulator is to keep the steam velocity constant on both sides of the regulator.
- Each pressure sensing line should slope downwards, away from the regulator, to prevent condensate from entering the pilot.
- Eccentric reducers, if required, are used on valve inlets to prevent accumulation of condensate which could become entrained with high-velocity steam, possibly resulting in dangerous waterhammer.
- While the separator shown upstream is appropriate for protection of the PRV, it is not always required, as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be "wet" and the entrained moisture could affect valve performance and/or result in component damage.
- Consider installing a properly sized bypass line with globe valve to provide continuous operation should regulator maintenance be required.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- A safety relief valve (SRV) is appropriate where applicable codes dictate their requirement, or anywhere protection of downstream piping and equipment from over-pressurization is desired. The SRV needs to handle the complete volume of steam from the regulator and bypass loop. Consult the factory for appropriate SRV sizing guidelines.
- When the pressure drop exceeds the recommended operation of a single-stage PRV, a 2-Stage (Series) station should be used. Orifice plates may also be considered to limit pressure drop across a single-stage PRV and reduce noise. Consult the factory for sizing and selection assistance.

REGULATING VALVE APPLICATIONS

PRESSURE REDUCING STATION • Parallel for High Flow Turndown to Deaerator

Figure 10:

PARALLEL Pressure Reducing Station for Deaerator Tank
(HD Regulator Applications)

REGULATING VALVE APPLICATIONS

PRESSURE REDUCING STATION • for Combination High Pressure & High Flow Turndown

PURPOSE:

For reducing steam system inlet pressure to a constant outlet pressure when flow conditions vary widely combined with a high pressure drop (i.e. higher than the recommended range of a single-stage regulator).

OPERATION:

This system is a combination of Two-Stage (Series) and Parallel pressure reducing stations and operates based on the individual principles of each system. Each series of valves will be sized to handle a portion of the total maximum load demand, typically 1/3 and 2/3 of the total anticipated flow. If the smaller series of valves is determined to operate as the primary, then the 2nd stage valve will be set 2 psi higher than the 2nd stage valve in the secondary series. This allows the primary series to be the only one flowing when demand is low. When flow increases and the primary series cannot keep up with demand, the downstream pressure will begin to drop which will allow the larger secondary series of valves to open in order to help satisfy the demand.

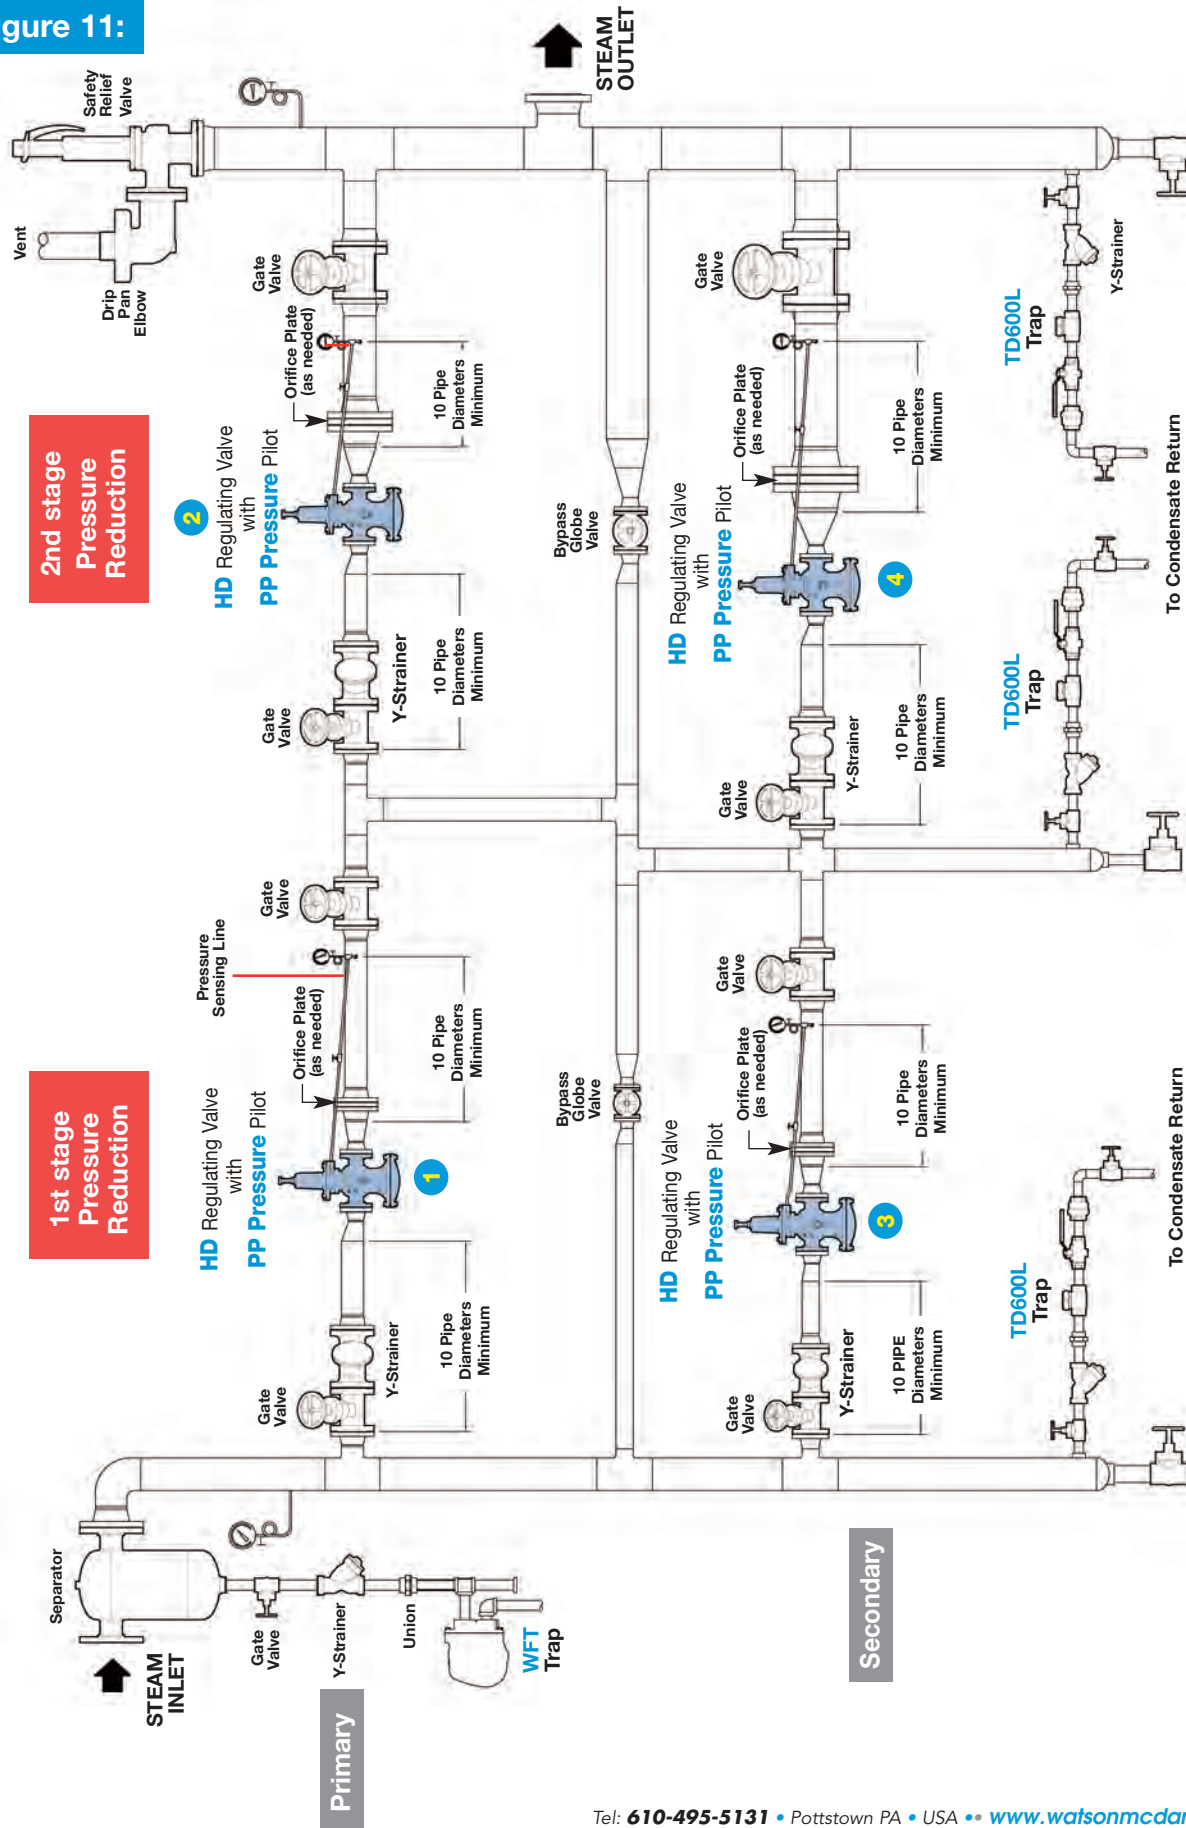

INSTALLATION GUIDELINES:

(see Figure 11)

- This example depicts a two-stage parallel pilot-operated steam PRV pressure reducing station using HD Regulators with Pressure Pilot. An external sensing line is required to sense downstream pressure from each regulator. The end of each sensing line is placed away from the turbulent flow at the valve outlet. This helps to improve accuracy of the set pressures. Set pressure for each PRV is adjusted by turning a screw on the pilot to increase or decrease compression on a balancing spring.
- Proper setting of the valves is key to proper operation. The chosen 1st stage primary valve should be set at a pressure approximately 2 PSI higher than that of the 1st stage secondary valve.
- For optimum operation and service life, maintain recommended minimum piping straight runs before and after the PRV. Inlet pipe diameters could be 1-2 sizes larger and outlet pipe diameters 2-3 sizes larger than the end connections of an appropriately sized PRV. The purpose of increasing the pipe size downstream of the regulator is to keep the steam velocity constant on both sides of the regulator.
- Each pressure sensing line should slope downwards, away from the regulator, to prevent condensate from entering the pilot.
- Eccentric reducers, if required, are used on valve inlets to prevent accumulation of condensate which could become entrained with high-velocity steam, possibly resulting in dangerous waterhammer.
- While the separator shown upstream is appropriate for protection of the PRVs, it is not always required, as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be "wet" and the entrained moisture could affect valve performance and/or result in component damage.
- Consider installing a properly sized bypass line with globe valve on each stage, to provide continuous operation should regulator maintenance be required.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- A safety relief valve (SRV) is appropriate where applicable codes dictate their requirement, or anywhere protection of downstream piping and equipment from over-pressurization is desired. The SRV needs to handle the complete volume of steam from the regulator and bypass loops. Consult the factory for appropriate SRV sizing guidelines.
- Orifice plates help reduce pipeline noise and are available as needed. Series OP orifice plates are custom engineered to maximize noise attenuation and reduce dbA to the lowest achievable value. The number and diameter of holes will be determined based on application conditions, and the plate diameter will typically be equal to the recommended downstream pipe size. The regulator(s) must be sized in conjunction with the orifice plate. For PRV and orifice plate sizing, consult the factory or SteamWorx sizing program on www.watsonmcdaniel.com.

PRESSURE REDUCING STATION • for Combination High Pressure & High Flow Turndown

Figure 11:

TWO-STAGE PARALLEL Pressure Reducing Station
(HD Regulator Applications)

REGULATING VALVE APPLICATIONS

TEMPERATURE CONTROL

of a BATCH PROCESS with Electrical Time Sequence Programmer (Solenoid Pilot)

PURPOSE: For accurately controlling temperature of a batch process where on-off operation is to be electronically controlled.

OPERATION: Operation is similar to that of the pressure and temperature combination pilot-operated regulator whereby the temperature (PT) pilot senses the temperature of the heated product (e.g. water) and appropriately modulates the flow of steam. Pressure is limited by the pressure (PP) pilot. The solenoid valve (PS-pilot) is electronically activated to control on-off operation of the batch process.

INSTALLATION GUIDELINES: (see Figure 12)

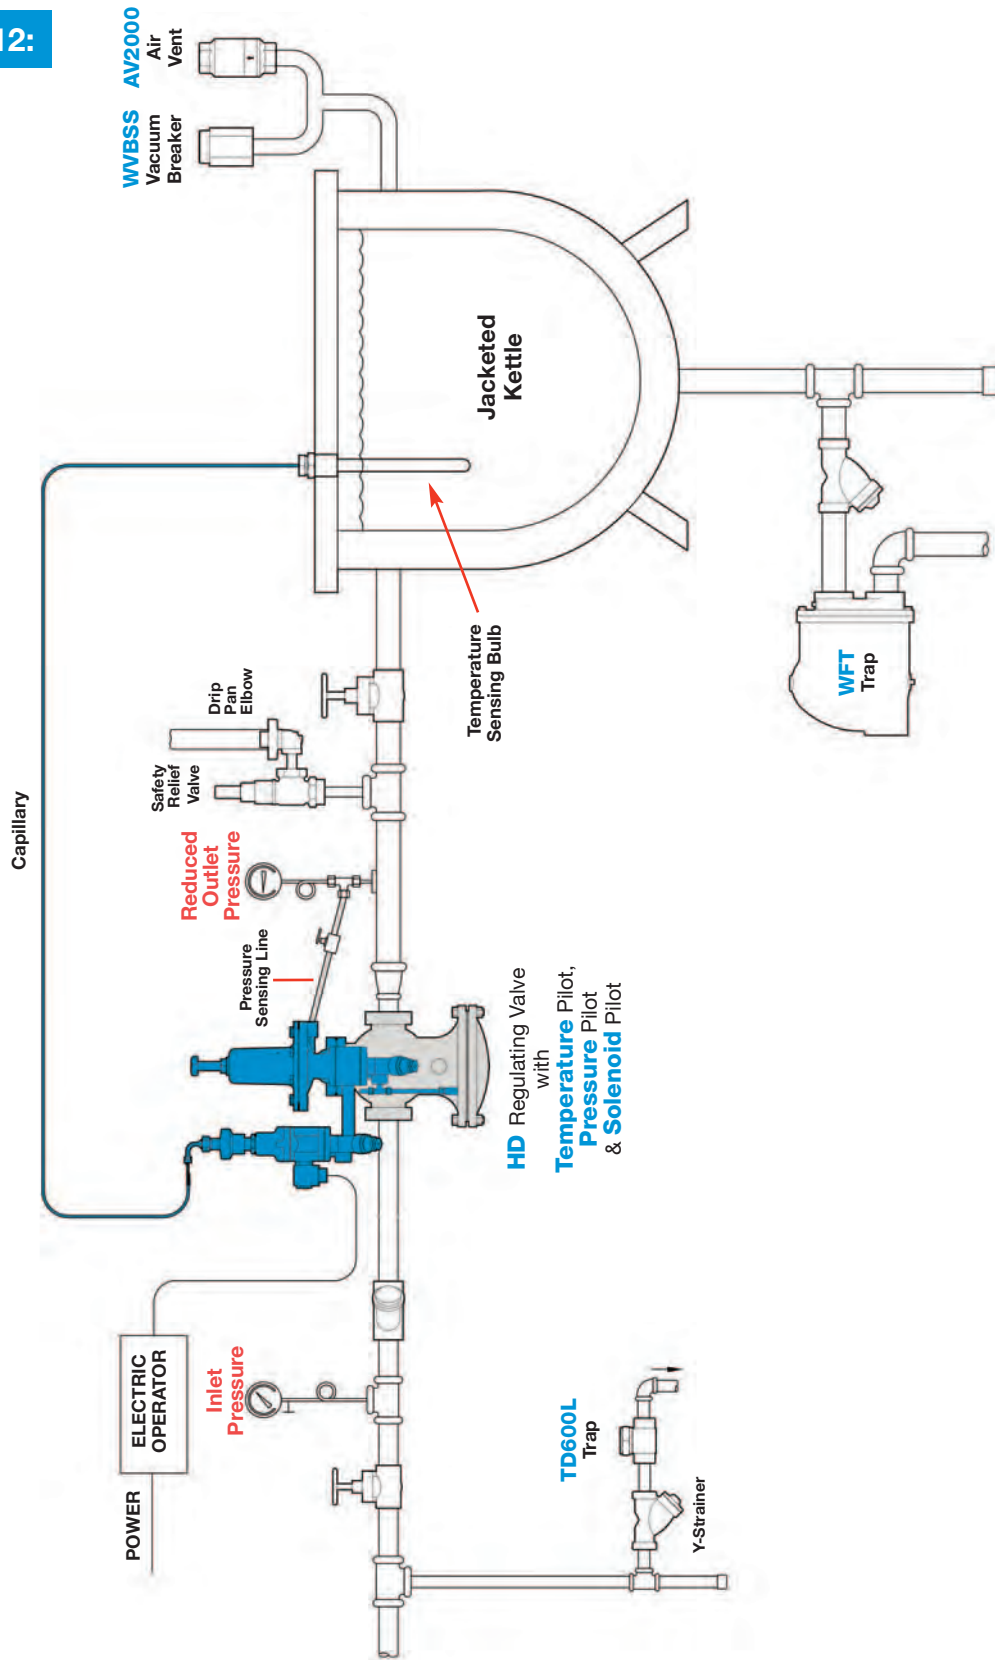

- The temperature and pressure pilots should be set individually, starting slowly and gradually with the PT-pilot.
- For optimum operation and service life, maintain recommended minimum piping straight runs before and after the PRV. Inlet pipe diameters could be 1-2 sizes larger and outlet pipe diameters 2-3 sizes larger than the end connections of an appropriately sized Regulator. The purpose of increasing the pipe size downstream of the regulator is to keep the steam velocity constant on both sides of the regulator.
- The pressure sensing line should slope downwards, away from the regulator, to prevent condensate from entering the pilot.
- Eccentric reducers, if required, are used on valve inlets to prevent accumulation of condensate which could become entrained with high-velocity steam, possibly resulting in dangerous waterhammer.
- While a separator is appropriate for protection of the Regulator, it is not always required, as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be "wet" and the entrained moisture could affect valve performance and/or result in component damage.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- The vacuum breaker and auxiliary air vent located at the top of the jacketed kettle vessel promotes proper drainage and optimum heat transfer. The vacuum breaker allows system equalization with atmospheric air to allow gravity condensate drainage when vacuum is formed from condensing steam. The air vent improves heat-up times and overall heat transfer by expelling accumulated air on start-up.
- A safety relief valve (SRV) is appropriate where applicable codes dictate their requirement, or anywhere protection of downstream piping and equipment from over-pressurization is desired. Consult the factory for appropriate SRV sizing guidelines.

REGULATING VALVE APPLICATIONS

TEMPERATURE CONTROL of a SEMI-INSTANTANEOUS HEATER using a Self-Contained Temperature Regulating Valve

PURPOSE:

For accurate control of the temperature of a product being heated when the benefits of a self-contained regulator are required.

OPERATION:

A self-contained temperature regulating valve (TRV) such as the W94, offers response times and characteristics suitable for semi-instantaneous heating applications. The temperature sensing bulb senses the temperature of the liquid being heated and allows modulation of the valve for appropriate supply of steam.

INSTALLATION GUIDELINES:

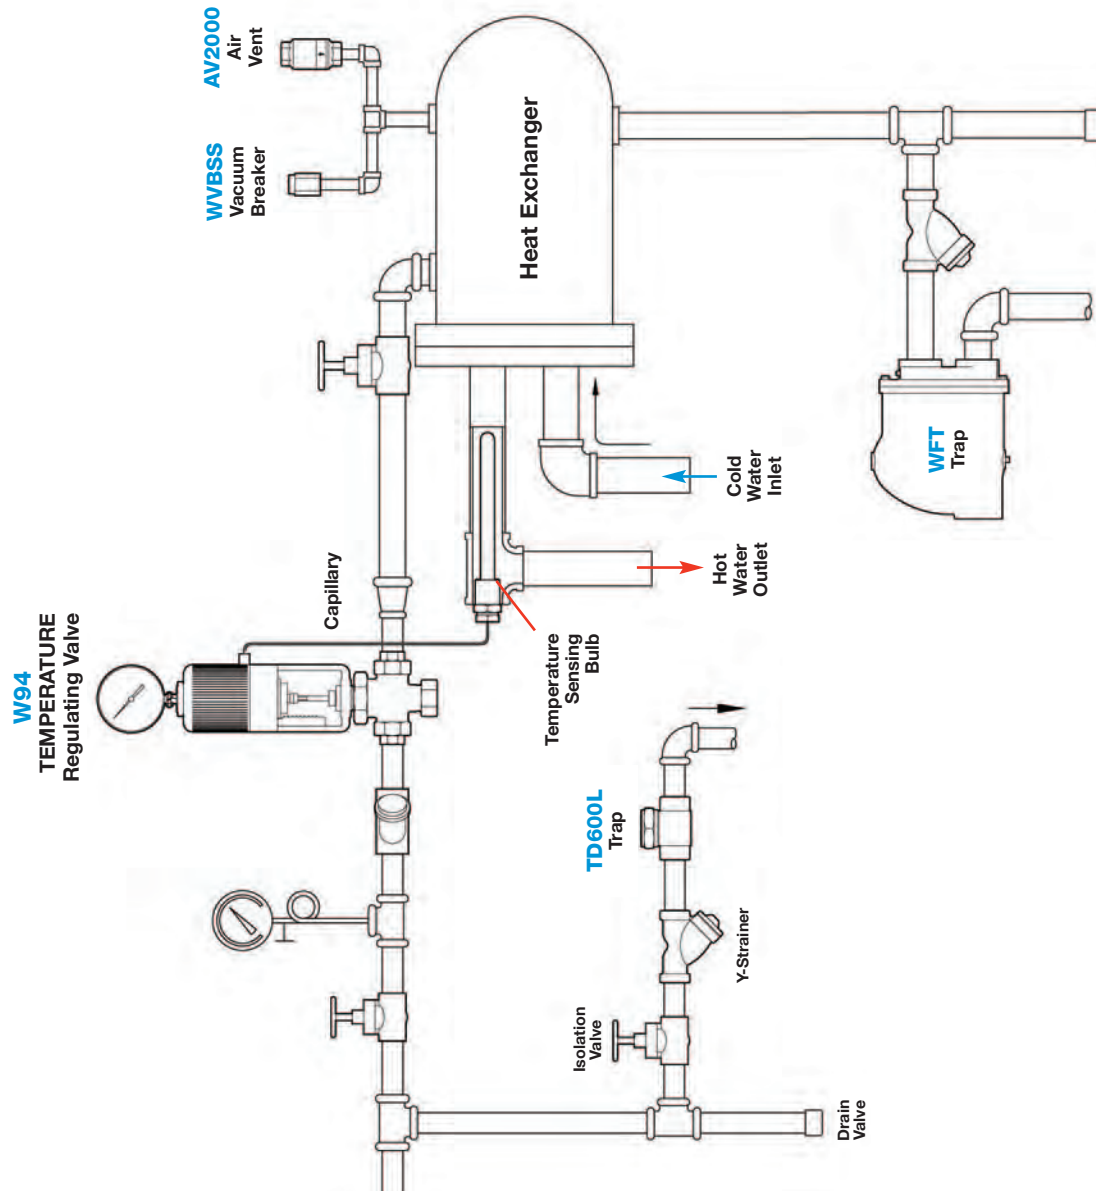

(see Figure 13)

- Care should be given to the installation of the temperature sensing bulb to ensure full immersion in the liquid. The sensing bulb should be placed as close as possible to the heater tank to ensure accurate temperature control of the process fluid.
- Eccentric reducers, if required, are used on valve inlets to prevent accumulation of condensate which could become entrained with high-velocity steam, possibly resulting in dangerous waterhammer.
- While a separator is appropriate for protection of the Regulator, it is not always required, as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be “wet” and the entrained moisture could affect valve performance and/or result in component damage.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- The vacuum breaker and auxiliary air vent located at the top of the heater tank promotes proper drainage and optimum heat transfer. The vacuum breaker allows system equalization with atmospheric air to allow gravity condensate drainage when vacuum is formed from condensing steam. The air vent improves heat-up times and overall heat transfer by expelling accumulated air on start-up.
- A safety relief valve (SRV) is appropriate where applicable codes dictate their requirement, or anywhere protection of downstream piping and equipment from over-pressurization is desired. Consult the factory for appropriate SRV sizing guidelines.

REGULATING VALVE APPLICATIONS

TEMPERATURE CONTROL of a SEMI-INSTANTANEOUS HEATER using a Self-Contained Temperature Regulating Valve

Figure 13:

Semi-Instantaneous Hot Water Heater with W94 Temperature Regulator
(Temperature Regulator Applications)

REGULATING VALVE APPLICATIONS

TEMPERATURE CONTROL of a SEMI-INSTANTANEOUS HEATER using a Pilot-Operated Temperature Regulating Valve

PURPOSE: For accurate control of the temperature of a product being heated when the benefits of a pilot-operated regulator are required.

OPERATION: A pilot-operated HD valve with PTRP temperature control pilot and PS solenoid pilot offers response times and characteristics suitable for semi-instantaneous heating applications. The temperature sensing bulb senses the temperature of the liquid being heated and allows modulation of the valve for appropriate supply of steam. The solenoid valve (PS-pilot) can be used to electronically activate on-off control of the heating process.

INSTALLATION GUIDELINES: (see Figure14)

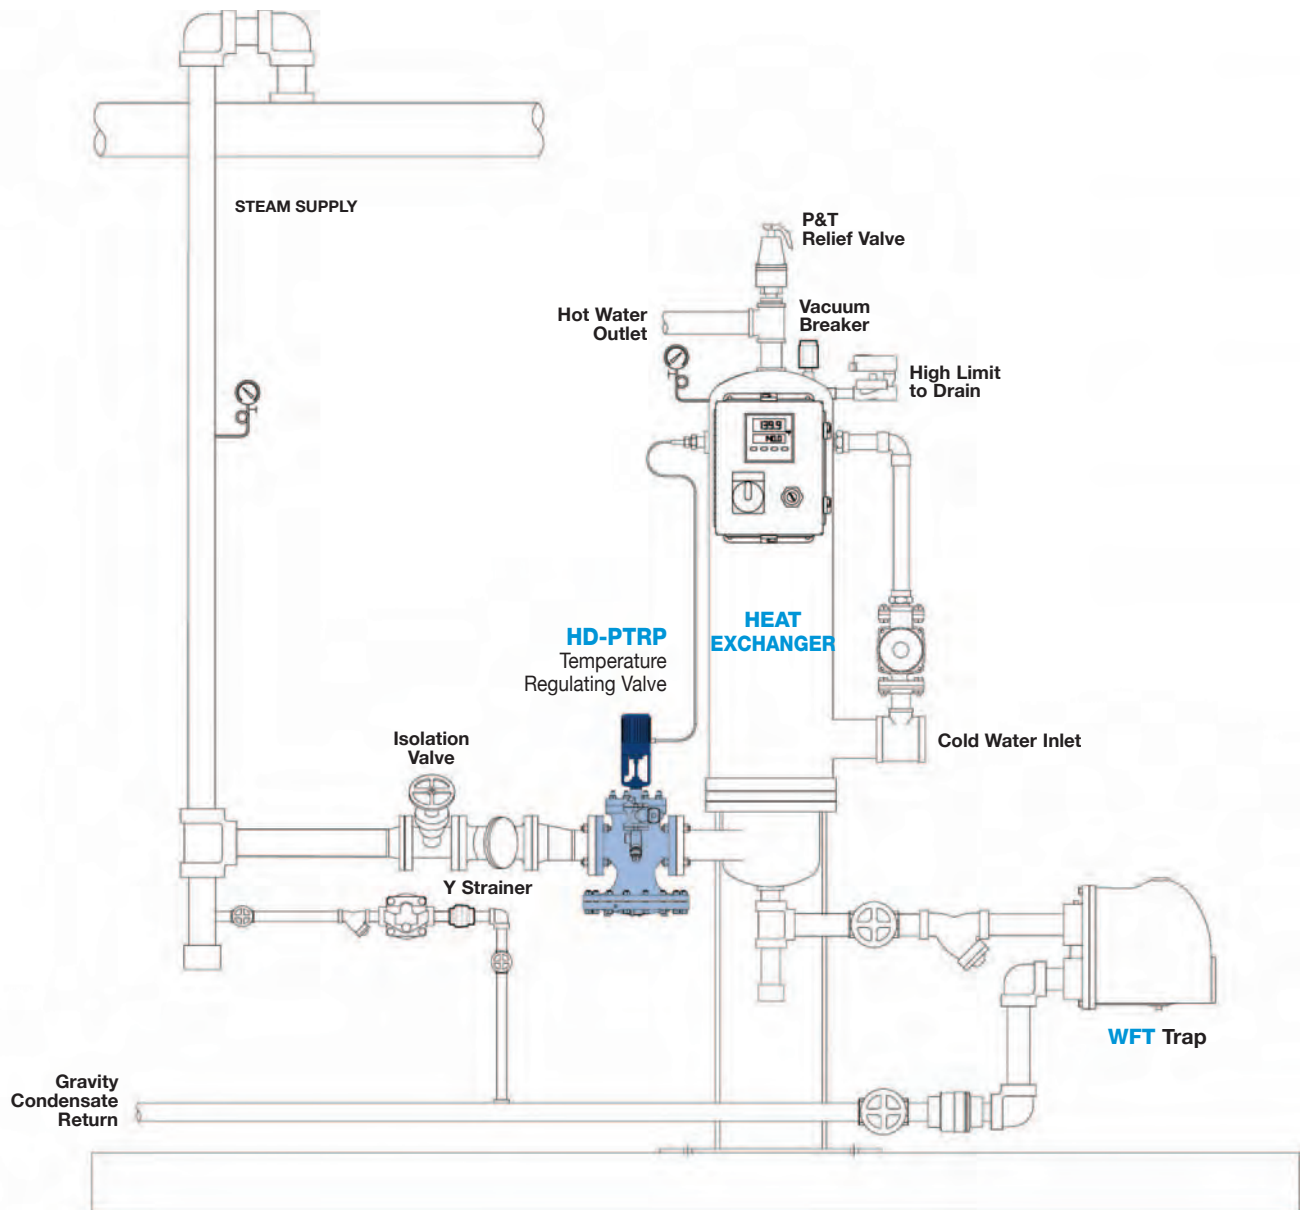

- Care should be given to the installation of the temperature sensing bulb to ensure full immersion in the liquid. The sensing bulb should be placed as close as possible to the heater tank to ensure accurate temperature control of the process fluid.
- Eccentric reducers, if required, are used on valve inlets to prevent accumulation of condensate which could become entrained with high-velocity steam, possibly resulting in dangerous waterhammer.
- While a separator is appropriate for protection of the Regulator, it is not always required, as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be “wet” and the entrained moisture could affect valve performance and/or result in component damage.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- A vacuum breaker and auxiliary air vent (not shown) should be properly installed to promote proper drainage and optimum heat transfer. The vacuum breaker allows system equalization with atmospheric air to allow gravity condensate drainage when vacuum is formed from condensing steam. The air vent improves heat-up times and overall heat transfer by expelling accumulated air on start-up.
- A safety relief valve (SRV, not shown) is appropriate where applicable codes dictate their requirement, or anywhere protection of downstream piping and equipment from over-pressurization is desired. Consult the factory for appropriate SRV sizing guidelines.
- Semi-instantaneous water heaters with pilot-operated temperature control valves are often used in conjunction with a storage tank or mixing station for optimum temperature control of the process fluid.

REGULATING VALVE APPLICATIONS

TEMPERATURE CONTROL of a SEMI-INSTANTANEOUS HEATER

using a Pilot-Operated Temperature Regulating Valve

Figure 14:

Semi-Instantaneous Hot Water Heater with HD-PTRP Temperature Regulator
(HD Regulator Applications)

CONTROL VALVE APPLICATIONS

TEMPERATURE CONTROL of a SEMI-INSTANTANEOUS HEATER using a Temperature Control Valve

PURPOSE:

For accurate control of the temperature of a product being heated when the benefits of a temperature control valve are required.

OPERATION:

A temperature control valve offers response times and characteristics suitable for semi-instantaneous heating applications. The temperature sensor (RTD or Thermocouple) senses the temperature of the liquid being heated and allows modulation of the valve for appropriate supply of steam through the complete control loop. Pneumatic or modulating electric actuators may be used.

INSTALLATION GUIDELINES:

(see Figure15)

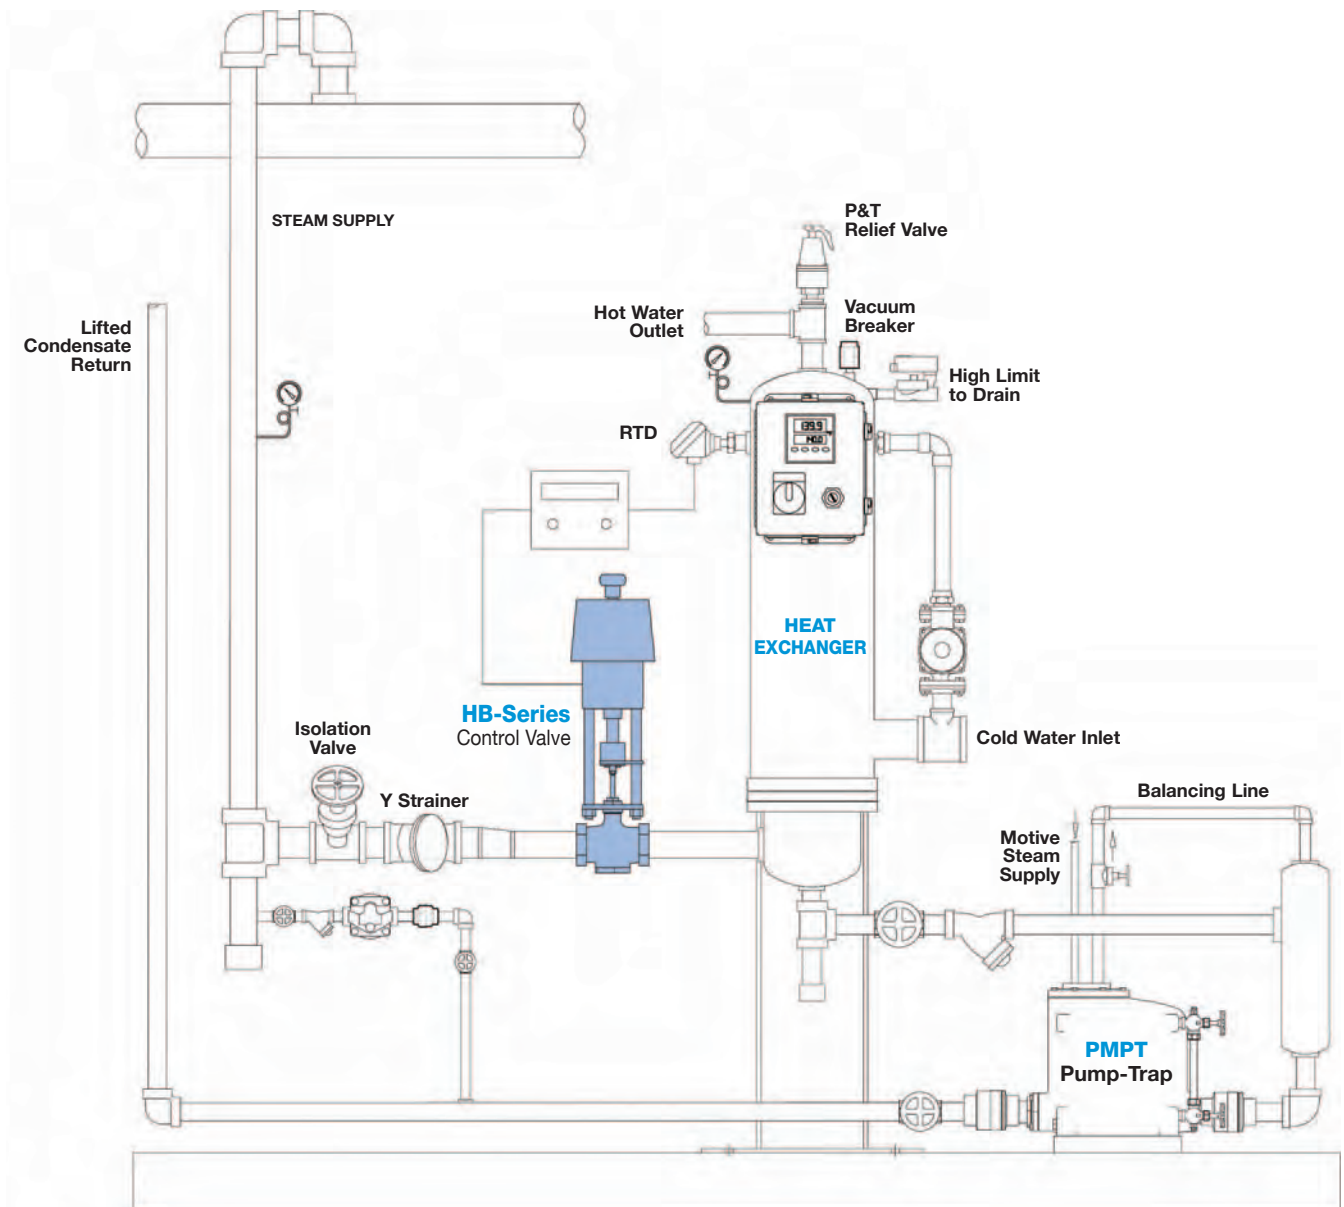

- Care should be given to the installation of the temperature sensor to ensure full immersion in the liquid. The sensor should be placed as close as possible to the heater tank to ensure accurate temperature control of the process fluid.
- When using a pneumatically-actuated control valve, a valve positioner will provide enhanced control, stability, and shut-off capability in extreme flow applications. The positioner is mounted to the valve (integral on certain electric actuators) and receives a signal from an external control source, compares the control signal to the actual position of the valve plug, and then sends a corrected signal to the valve's actuator, thereby positioning the valve plug for optimum flow modulation.
- Eccentric reducers, if required, are used on valve inlets to prevent accumulation of condensate which could become entrained with high-velocity steam, possibly resulting in dangerous waterhammer.
- While a separator is appropriate for protection of the Regulator, it is not always required, as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be "wet" and the entrained moisture could affect valve performance and/or result in component damage.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- A vacuum breaker and auxiliary air vent (not shown) should be properly installed to promote proper drainage and optimum heat transfer. The vacuum breaker allows system equalization with atmospheric air to allow gravity condensate drainage when vacuum is formed from condensing steam. The air vent improves heat-up times and overall heat transfer by expelling accumulated air on start-up.
- A safety relief valve (SRV, not shown) is appropriate where applicable codes dictate their requirement, or anywhere protection of downstream piping and equipment from over-pressurization is desired. Consult the factory for appropriate SRV sizing guidelines.
- The use of semi-instantaneous water heaters in conjunction with a storage tank or mixing station is typically not needed when using fast-acting control valves with high rangeability. Because the storage tank or mixing station will generally result in less demand variation, the control valve may cycle unnecessarily resulting in erratic control and or damage. Care should be taken to properly size the valve and select the appropriate actuator if a storage tank or mixing station is used. Consult the factory for sizing and selection guidelines.

CONTROL VALVE APPLICATIONS

(HB Control Valve Applications)

CONTROL VALVE APPLICATIONS

TEMPERATURE CONTROL of a SEMI-INSTANTANEOUS HEATER using a Temperature Control Valve

PURPOSE:

For accurate control of the temperature of a product being heated when the benefits of a temperature control valve are required.

OPERATION:

A temperature control valve offers response times and characteristics suitable for continuous heating applications with wide variations in flow demand. The temperature sensor (RTD or Thermocouple) senses the temperature of the liquid being heated and allows modulation of the valve for appropriate supply of steam through the complete control loop. Pneumatic or modulating electric actuators may be used.

INSTALLATION GUIDELINES:

(see Figure16)

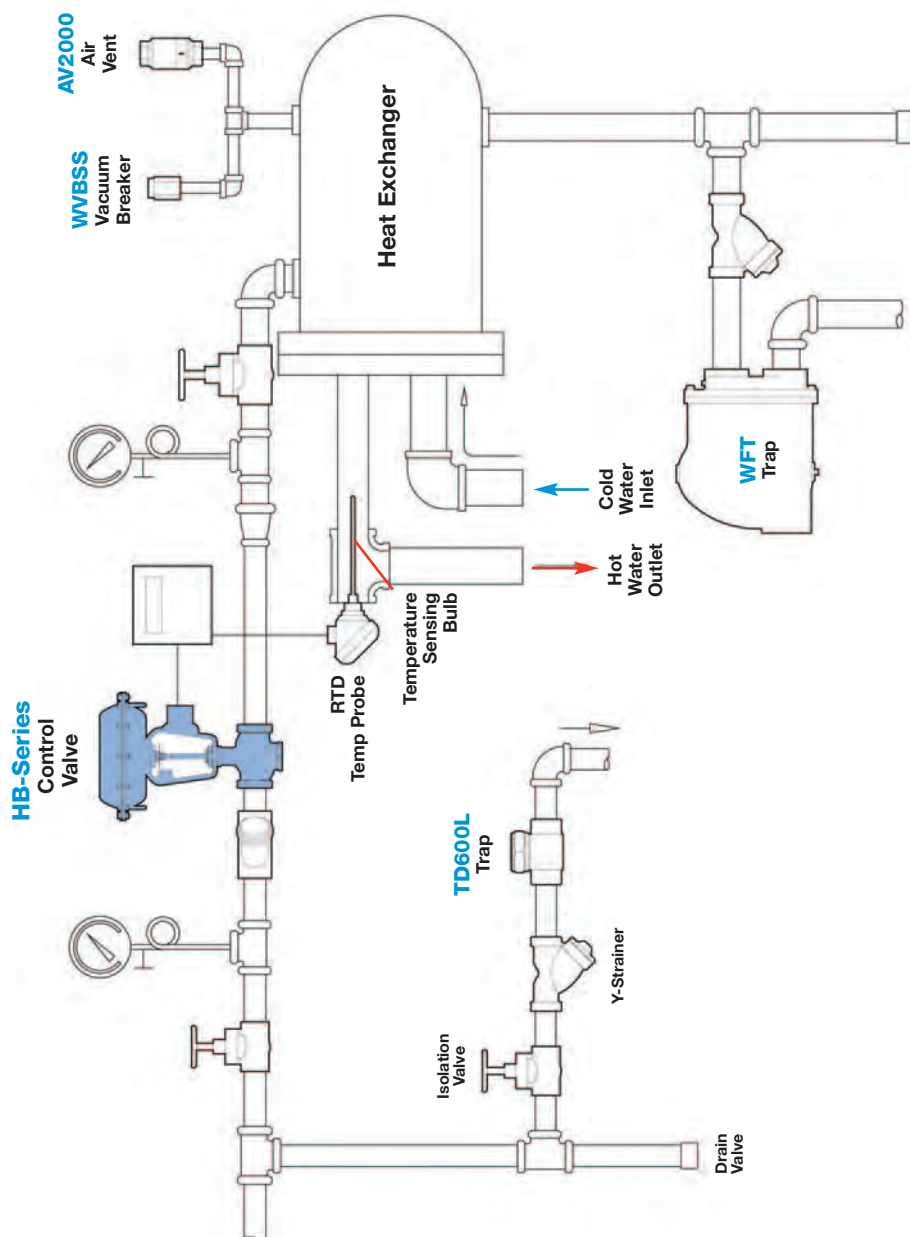

- Care should be given to the installation of the temperature sensor to ensure full immersion in the liquid. The sensor should be placed as close as possible to the heater tank to ensure accurate temperature control of the process fluid.
- Eccentric reducers, if required, are used on valve inlets to prevent accumulation of condensate which could become entrained with high-velocity steam, possibly resulting in dangerous waterhammer.
- While a separator is appropriate for protection of the Regulator, it is not always required, as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be “wet” and the entrained moisture could affect valve performance and/or result in component damage.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- A vacuum breaker and auxiliary air vent should be properly installed to promote proper drainage and optimum heat transfer. The vacuum breaker allows system equalization with atmospheric air to allow gravity condensate drainage when vacuum is formed from condensing steam. The air vent improves heat-up times and overall heat transfer by expelling accumulated air on start-up.
- A safety relief valve (SRV, not shown) is appropriate where applicable codes dictate their requirement, or anywhere protection of downstream piping and equipment from over-pressurization is desired. Consult the factory for appropriate SRV sizing guidelines.

CONTROL VALVE APPLICATIONS

using a Temperature Control Valve

Figure 16:

Semi-Instantaneous Hot Water Heater with HB Series Control Valve
(HB Control Valve Applications)

CONTROL VALVE APPLICATIONS

TEMPERATURE CONTROL of an AIR HEATING COIL

using a Temperature Control Valve

PURPOSE:

For accurate control of the temperature of air when the benefits of a control valve are required. The air may be heated through a single coil or bank of multiple coils referred to as an Air Handling Unit (AHU).

OPERATION:

A temperature control valve offers response times and characteristics suitable for continuous heating applications with wide variations in flow demand. The temperature sensor (RTD or Thermocouple) senses the temperature of the liquid being heated and allows modulation of the valve for appropriate supply of steam through the complete control loop. Pneumatic or modulating electric actuators may be used.

INSTALLATION GUIDELINES: (see Figure17)

- Care should be given to the installation of the temperature sensor to ensure full immersion in the liquid. The sensor should be placed as close as possible to the heater tank to ensure accurate temperature control of air.
- When the AHU is located near the ground, the steam trap from each coil is recommended to have inline connections in order to limit height and maximize the ability to drain by gravity. It is recommended to have a separate steam trap on each individual coil.
- Eccentric reducers, if required, are used on valve inlets to prevent accumulation of condensate which could become entrained with high-velocity steam, possibly resulting in dangerous waterhammer.
- While a separator is appropriate for protection of the Regulator, it is not always required, as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be “wet” and the entrained moisture could affect valve performance and/or result in component damage.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- A vacuum breaker and auxiliary air vent should be properly installed to promote proper drainage and optimum heat transfer. The vacuum breaker allows system equalization with atmospheric air to allow gravity condensate drainage when vacuum is formed from condensing steam. The air vent improves heat-up times and overall heat transfer by expelling accumulated air on start-up.
- A safety relief valve (SRV, not shown) is appropriate where applicable codes dictate their requirement, or anywhere protection of downstream piping and equipment from over-pressurization is desired. Consult the factory for appropriate SRV sizing guidelines.

CONTROL VALVE APPLICATIONS

using a Temperature Control Valve

Figure 17:

Air Handling Unit (AHU) with HB Series Control Valve
(HB Control Valve Applications)

CONTROL VALVE APPLICATIONS

PRESSURE REDUCING STATION

Using a Pneumatically-Actuated Control Valve

PURPOSE: For reducing system inlet pressure to a constant outlet pressure.

OPERATION: The control valve is one component of a control loop and relies upon other components for proper function (i.e. controller, sensor, transducer, etc.). The set pressure is adjusted through a controller interface.

INSTALLATION GUIDELINES: (see Figure18)

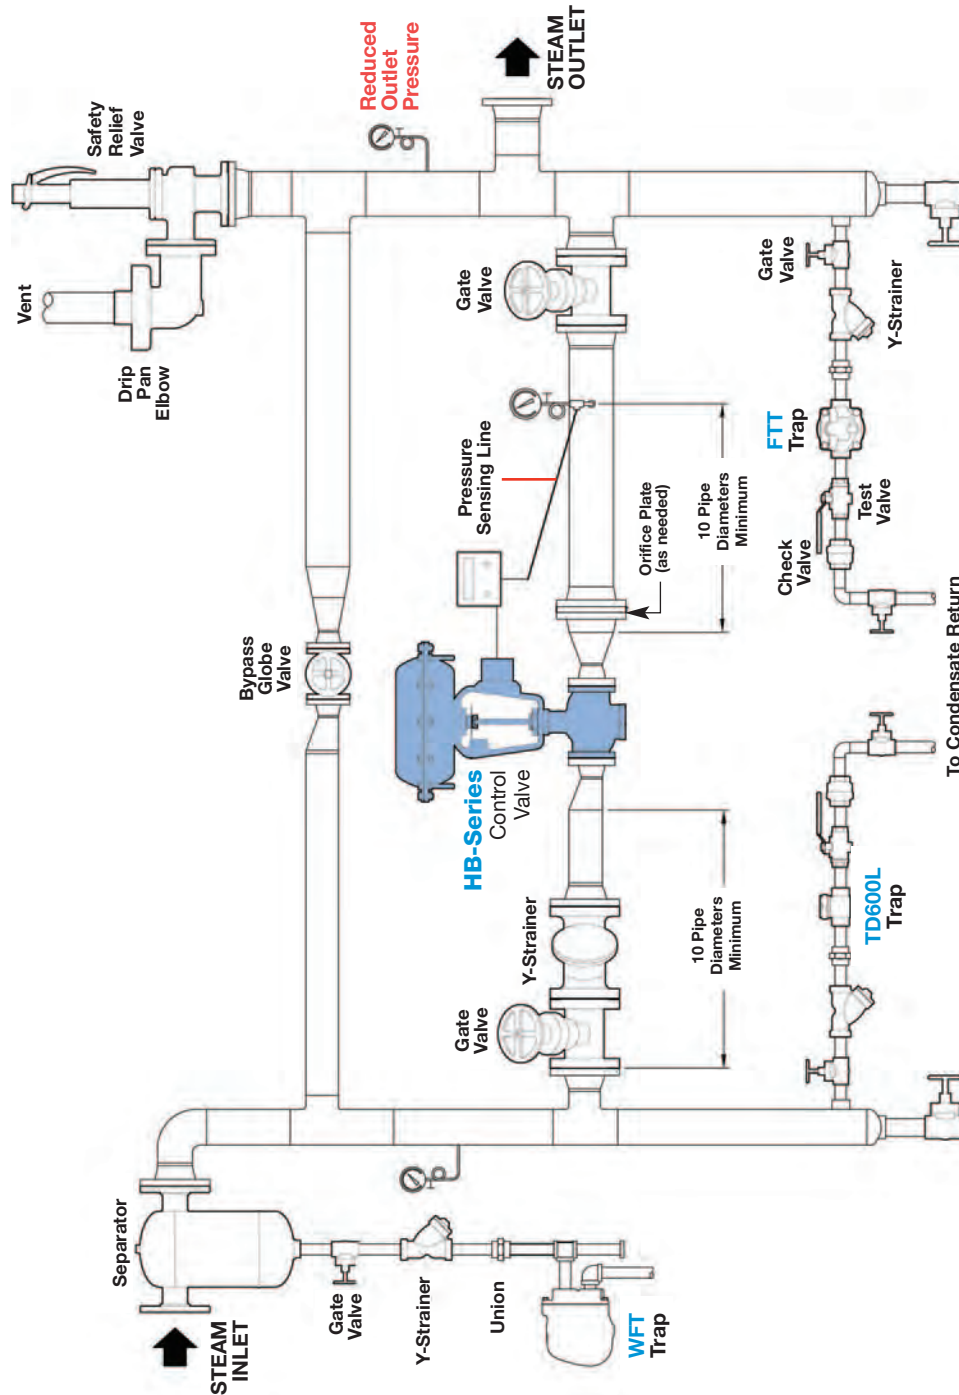

- This example depicts a control valve used for pressure reducing of steam (similar for other fluids such as water), whereby a pressure transducer gauge or sensor is used to sense downstream pressure. The pressure sensor is placed away from the turbulent flow of the valve outlet. This helps to improve accuracy of the set pressure. Set pressure is adjusted through a controller which is one component of the control loop.
- For optimum operation and service life, maintain recommended minimum piping straight runs before and after the PRV. Inlet pipe diameters could be 1-2 sizes larger and outlet pipe diameters 2-3 sizes larger than the end connections of an appropriately sized PRV. The purpose of increasing the pipe size downstream of the regulator is to keep the steam velocity constant on both sides of the regulator.
- Eccentric reducers, if required, are used on valve inlets to prevent accumulation of condensate which could become entrained with high-velocity steam, possibly resulting in dangerous waterhammer.
- While a separator is appropriate for protection of the Regulator, it is not always required, as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be “wet” and the entrained moisture could affect valve performance and/or result in component damage.
- Consider installing a properly sized bypass line with globe valve to provide continuous operation should control valve maintenance be required.
- Consider low-cracking pressure (1/4 PSI opening pressure) check valves after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- A safety relief valve (SRV, not shown) is appropriate where applicable codes dictate their requirement, or anywhere protection of downstream piping and equipment from over-pressurization is desired. The SRV needs to handle the complete volume of Steam from the Control Valve and Bypass Loop. Consult the factory for appropriate SRV sizing guidelines.
- Orifice plates help reduce pipeline noise and are available as needed. Series OP orifice plates are custom engineered to maximize noise attenuation and reduce dbA to the lowest achievable value. The number and diameter of holes will be determined based on application conditions, and the plate diameter will typically be equal to the recommended downstream pipe size. The regulator(s) must be sized in conjunction with the orifice plate. For PRV and orifice plate sizing, consult the factory or SteamWorx sizing program on www.watsonmcdaniel.com.

CONTROL VALVE APPLICATIONS

PRESSURE REDUCING STATION

Using a Pneumatically-Actuated Control Valve

Figure 18:

SINGLE STAGE Pressure Reducing Station using HB Series Control Valve
(HB Control Valve Applications)

CONTROL VALVE APPLICATIONS

BOILER FEED • Using Water Control Valve with Cavitation Control

PURPOSE: For accurate supply of feed water into a boiler.

OPERATION: The boiler feed control valve is connected to a controller and level transmitter which monitors the water level in the boiler. When water level drops, the controller sends a signal to the control valve to modulate open to supply additional feed water as needed. This arrangement limits cycling of the feed water pump and provides more consistent steam load and supply pressure from the boiler.

INSTALLATION GUIDELINES: (see Figure 19)

- Depending on the required pressure and temperature of feed water, cavitation may be present due to pressure drop and recovery through the control valve. Cavitation can cause noise, vibration, and damage to control valves and piping. If cavitation will exist in a particular application, cavitation adapters should be used to mitigate its effects. For control valve and cavitation adapter sizing, consult the factory or Steam Worx sizing program on www.watsonmcdaniel.com.
- For optimum operation and service life, maintain recommended minimum piping straight runs before and after the control valve. Inlet and outlet piping should be sized to maintain appropriate velocities for the feed water.
- When the valve actuator is electric, plan the installation location of the valve so that ambient conditions do not exceed the limits of the actuator. Insulation blankets may also be used for protection.
- Make certain there is at least one pipeline strainer installed between the feed water tank and the boiler feed control valve to protect the valve from pipeline scale and debris.

Figure 19:

BOILER FEED WATER APPLICATION using HB Series Control Valve
(HB Control Valve Applications)

CONTROL VALVE APPLICATIONS

FLOW MIXING APPLICATION • Using 3-Way Control Valve

PURPOSE:

For combining 2 separate fluid streams typically for the purpose of improved temperature control by mixing or blending.

OPERATION:

The 3-Way Control Valve in this system is used to blend the heated water and loop return water to produce precise temperature for the hot water loop. At lower temperature sensed by the RTD, the 3-way valve will modulate to fully open the A port and close the B port. This will allow maximum heated water from the heat exchanger to flow through the valve and supply hot water to the rest of the system. As the temperature of the loop return water rises, the 3-way valve will modulate to use less of the water from the heat exchanger and more from the loop return, thereby reducing the steam load to the heat exchanger.

INSTALLATION GUIDELINES:

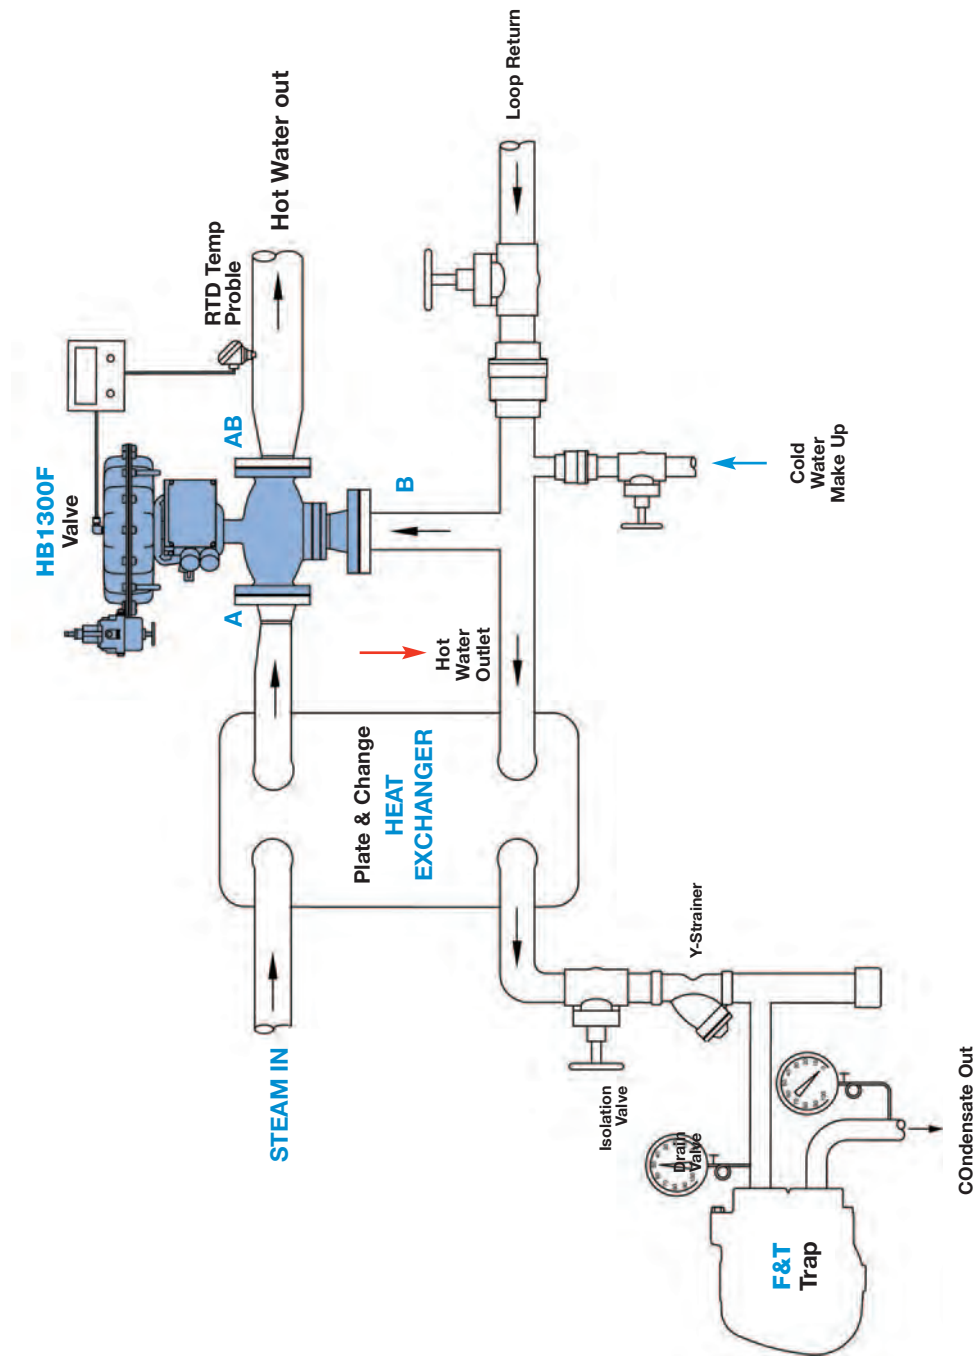

(see Figure 20)

- The inlet pressure of the (2) flow streams must be equal.
- For optimum operation and service life, maintain recommended minimum piping straight runs before and after the control valve. Inlet and outlet piping should be sized to maintain appropriate velocities for the feed water.
- When the valve actuator is electric, plan the installation location of the valve so that ambient conditions do not exceed the limits of the actuator. Insulation blankets may also be used for protection.
- Make certain there is at least one pipeline strainer installed on each of the supply lines to protect the valve from pipeline scale and debris.

CONTROL VALVE APPLICATIONS

FLOW MIXING APPLICATION • Using 3-Way Control Valve

Figure 20:

HOT WATER LOOP BLENDING using 3-Way HB Series Control Valve
(HB Control Valve Applications)

CONTROL VALVE APPLICATIONS

FLOW DIVERTING • Using 3-Way Control Valve

PURPOSE:

For separating a single fluid stream into 2 streams for the purpose of either splitting it or diverting excess flow.

OPERATION:

The 3-Way Control Valve in this system is used to divert excess flow from the coil when demand is not required. If the coil is being used for heating air, the RTD sensor will sense the air temperature and modulate so the A port opens to direct maximum hot water through the coil to raise the air temperature. As the coil nears set temperature the valve will modulate to reduce the amount of flow to the coil. Once the air temperature is at set point, the valve will close the A port and open the B port to divert excess hot water into a bypass line. Diverting flow through the B port is for recirculation to protect pumps from overheating if demand decreases. This arrangement would be representative of both heating and cooling coils.

INSTALLATION GUIDELINES:

(see Figure 21)

- Outlet pressures must be close to equal to provide consistent pressure differential on both fluid streams when partial flows must be maintained.
- For optimum operation and service life, maintain recommended minimum piping straight runs before and after the control valve. Inlet and outlet piping should be sized to maintain appropriate velocities for the feedwater.
- When the valve actuator is electric, plan the installation location of the valve so that ambient conditions do not exceed the limits of the actuator. Insulation blankets may also be used for protection.
- Make certain there is at least one pipeline strainer installed on the supply lines to protect the valve from pipeline scale and debris.

CONTROL VALVE APPLICATIONS

Figure 21:

FLOW DIVERTING using 3-Way HB Series Control Valve
(HB Control Valve Applications)

PMP & PUMP-TRAP APPLICATIONS

CONDENSATE RECOVERY • Using Pressure Motive Pump (PMP)

PURPOSE:

For recovering condensate from multiple sources when the total system back pressure is greater than the individual source pressures. The receiver tank is used to collect the condensate and properly vent system flash steam.

OPERATION:

Condensate from multiple sources at various pressures collects in a receiver (flash tank) for pressure equalization. This allows drainage by gravity into the Pressure Motive Pump (PMP), filling the PMP until the internal mechanism reaches its upper trip point and activates the motive steam used for pumping. Pressure from the flash steam generated by the hot condensate is vented to the atmosphere in order to equalize tank pressure to 0 psig. This assures that condensate will freely flow by gravity to the receiver tank and then to the pump tank, avoiding potential condensate back-up.

INSTALLATION GUIDELINES:

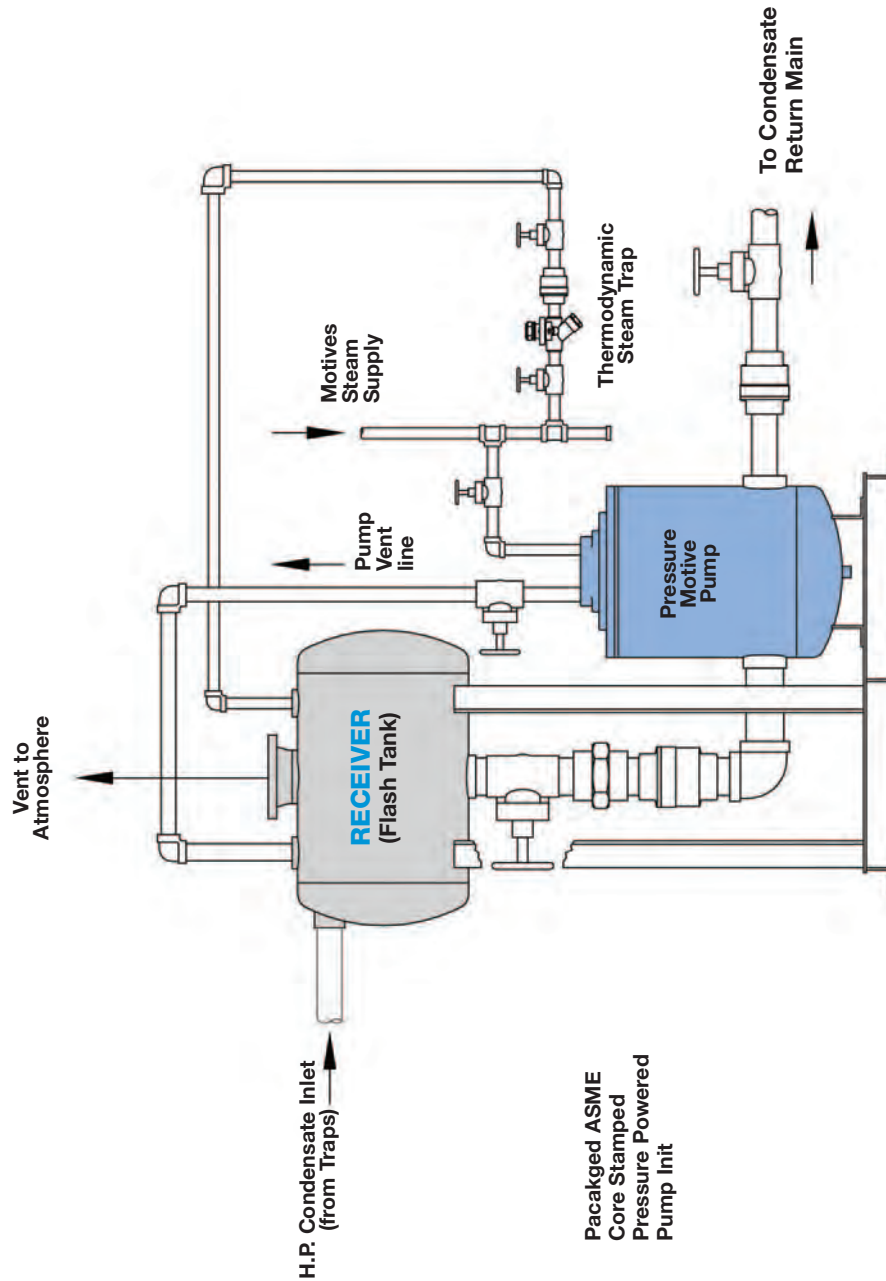

(see Figure 22)

- The receiver tank and receiver vent connection must be properly sized to accommodate the flash steam and allow for pressure equalization to atmospheric conditions. Consult appropriate sections of this catalog or the factory for guidelines regarding proper sizing of the receiver tank and receiver vent connection.
- Plan the installation of the receiver tank so it sits above the Pressure Motive Pump to maintain proper fill head above the top of the pump to ensure condensate enters the PMP by gravity. In most instances, the receiver tank should also be positioned below the incoming high pressure condensate delivery lines.
- Proper installation of the pump vent line is critical to ensure the system operates correctly. For best results, connect the pump vent line directly to the top of the receiver tank or to the receiver vent line making certain to avoid obstructions or low points. Consult factory for additional information.
- Low-cracking pressure (1/4 PSI opening pressure) check valves should be installed after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.

PMP & PUMP-TRAP APPLICATIONS

CONDENSATE RECOVERY • Using Pressure Motive Pump (PMP)

Figure 22:

CONDENSATE RECOVERY using Pressure Motive Pump (PMP)
(Pressure Motive Pump Applications)

PMP & PUMP-TRAP APPLICATIONS

CONDENSATE DRAINAGE • using Pump-Trap

PURPOSE:

For removing condensate from below steam heat transfer equipment when a modulating valve is used for control, and condensate discharge is elevated and/or pressurized, resulting in Stall condition.

OPERATION:

The Pressure Motive Pump (PMP) is used to overcome the stall condition that exists when steam feeding a single piece of heat transfer equipment is controlled by a modulating steam valve and steam pressure falls below system back pressure as the valve closes. A steam trap is required after the PMP to prevent the loss of live steam when the system is under positive pressure. Operating as a closed loop provides an energy-efficient system by eliminating the need to vent flash steam.

INSTALLATION GUIDELINES:

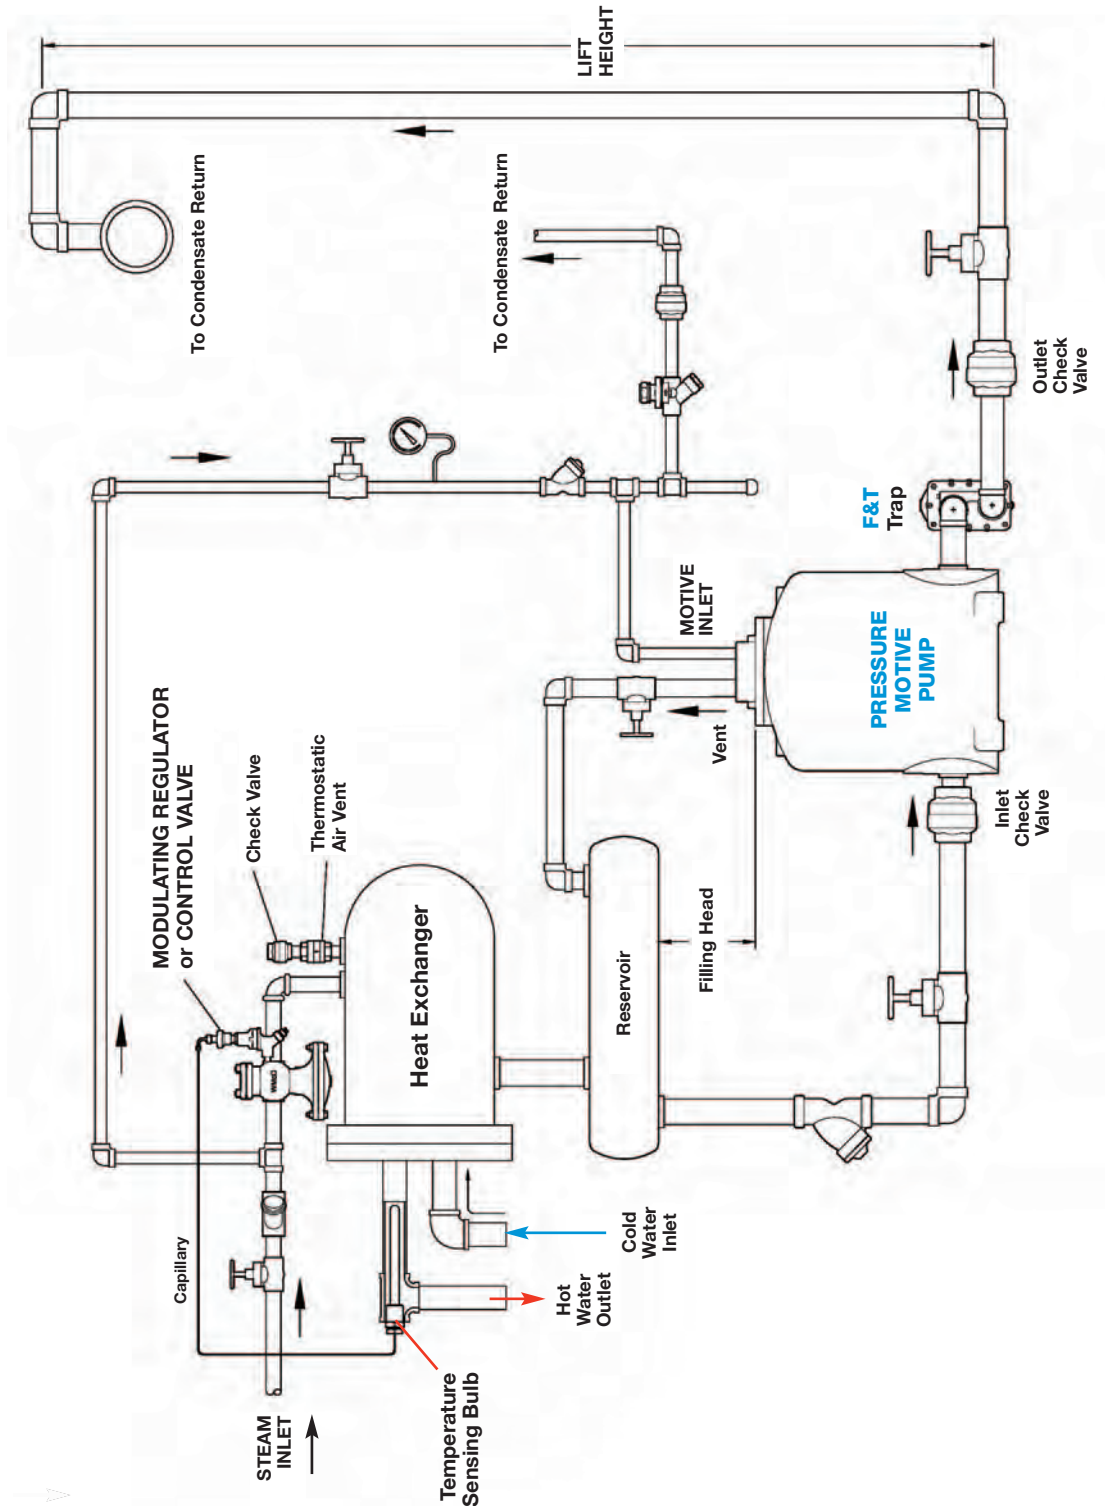

(see Figure 23)

- Proper installation and piping of the pump vent line is critical to ensure the system operates correctly. Follow guidelines or consult factory for additional information.
- Maintain proper fill head above the top of the pump to ensure proper function of the pump and system. A suitably sized reservoir or oversized piping should be installed ahead of the pump for accumulation of condensate during the pump's discharge cycle (i.e. when not filling).
- The steam trap after the pump must be sized in conjunction with the pump to ensure proper function as a system. Improper sizing may result in reduced capacity leading to condensate back-up, poor heat transfer and potentially dangerous waterhammer. Consult appropriate sections of this catalog or the factory for guidelines regarding proper sizing of the pump-trap combination.
- While a separator is appropriate for protection of the Regulator, it is not always required, as a properly sized drip leg with steam trap may be sufficient. It is recommended for systems where steam is known to be "wet" and the entrained moisture could affect valve performance and/or result in component damage.
- Low-cracking pressure (1/4 PSI opening pressure) check valves should be installed after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- The thermostatic air vent installed on the heat exchanger promotes optimum heat transfer. The air vent improves heat-up times and overall heat transfer by expelling accumulated air on start-up. When properly sized and installed, the pump-trap combination can operate in sub-atmospheric (i.e. vacuum) conditions; therefore, a vacuum breaker should not be used.

PMP & PUMP-TRAP APPLICATIONS

CONDENSATE DRAINAGE • using Pump-Trap

Figure 23:

Drainage of a Single Source of Condensate for a Closed Loop System
(Pump-Trap Applications)

PMP & PUMP-TRAP APPLICATIONS

CONDENSATE DRAINAGE from Below Grade • using Pump-Trap

PURPOSE:

For drainage of condensate from below process equipment where fill head is limited due to height restrictions and the pump must be installed below grade.

OPERATION:

When fill head is restricted and it is more suitable to create a pit below grade than reposition process equipment, the Pressure Motive Pump (PMP) may be modified so both condensate inlet and outlet connections are on top to limit the necessary pit size. When stall exists, condensate will accumulate between the inlet and outlet check valves and eventually drain into and fill the PMP tank. Once the PMP fills and its mechanism trips, high pressure motive steam will enter the pump tank and force condensate back out the same connection. The check valves will direct the flow of pumped condensate into the return piping.

INSTALLATION GUIDELINES:

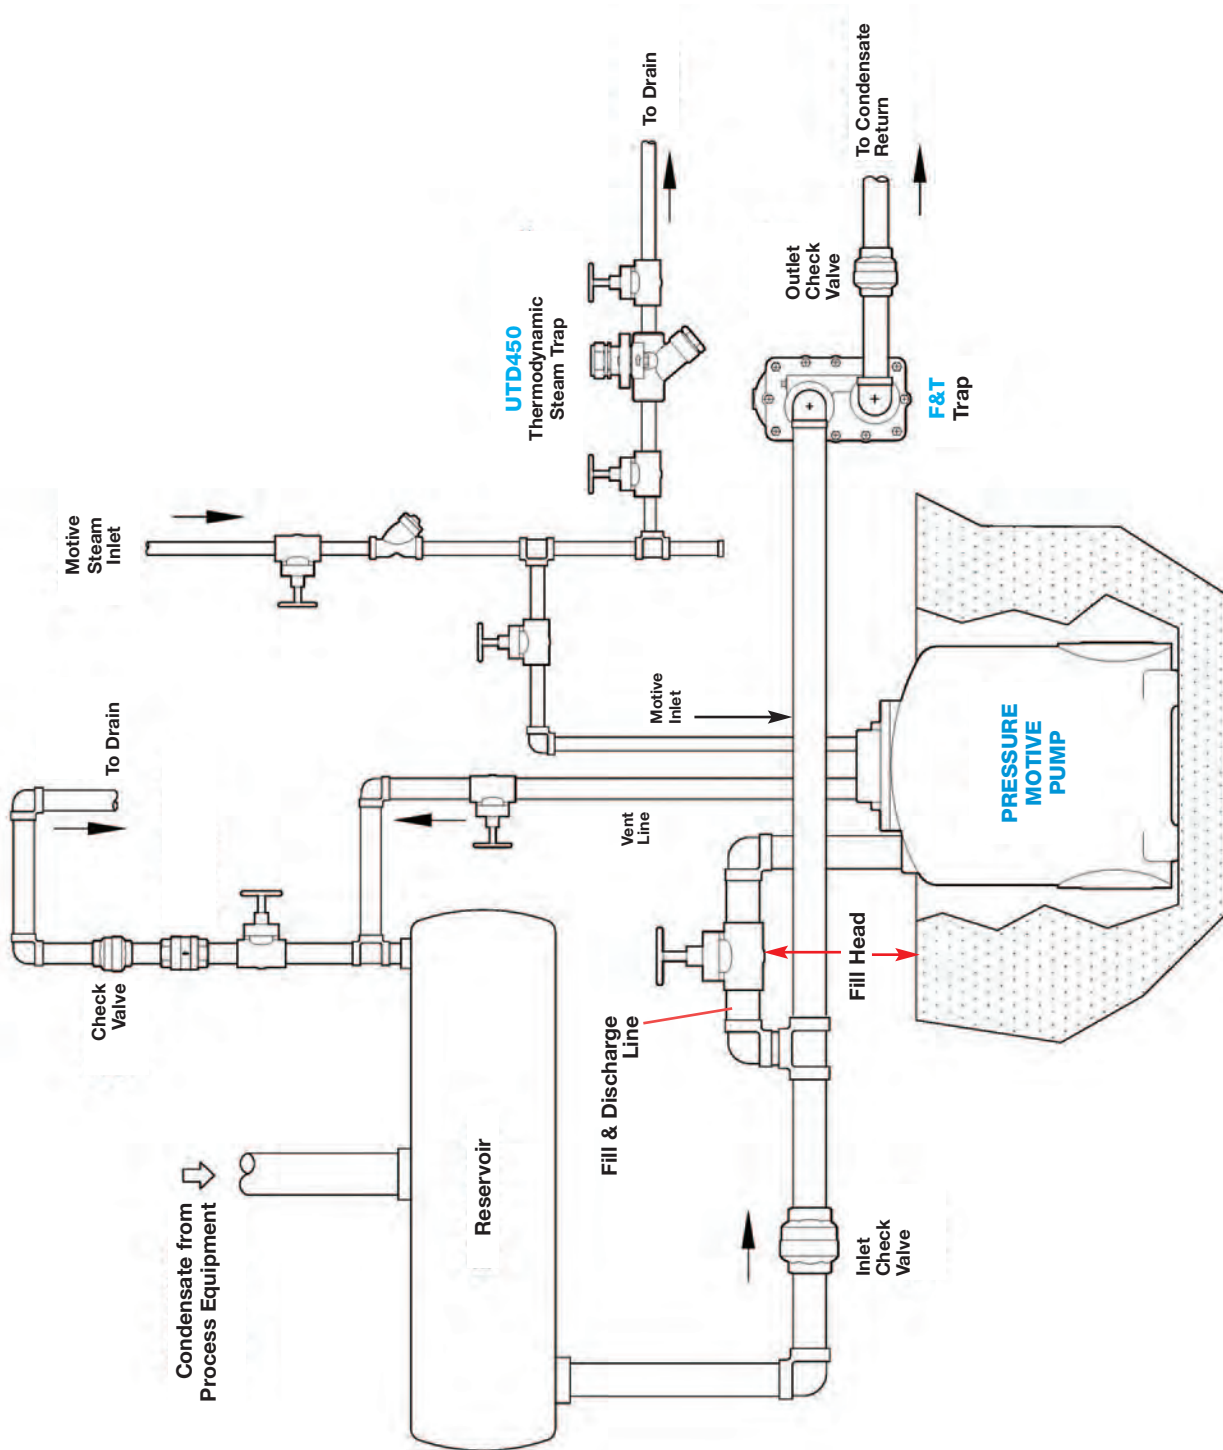

(see Figure 24)

- The positioning of the check valves and PMP fill/discharge line are the key elements which allow the system to function properly. The check valves dictate the proper direction of condensate flow for both fill and discharge cycles of the PMP. The PMP fill/discharge line should be taken off the top, as shown, so condensate only accumulates and fills the pump during stall.
- Proper installation and piping of the pump vent line is critical to ensure the system operates correctly. Follow guidelines or consult factory for additional information.
- Maintain proper fill head above the top of the pump to ensure proper function of the pump and system. A suitably sized reservoir or oversized piping should be installed ahead of the pump for accumulation of condensate during the pump's discharge cycle (i.e. when not filling).
- The steam trap after the pump must be sized in conjunction with the pump to ensure proper function as a system. Improper sizing may result in reduced capacity leading to condensate back-up, poor heat transfer and potentially dangerous waterhammer. Consult appropriate sections of this catalog or the factory for guidelines regarding proper sizing of the pump-trap combination.
- Low-cracking pressure (1/4 PSI opening pressure) check valves should be installed after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.

PMP & PUMP-TRAP APPLICATIONS

CONDENSATE DRAINAGE from Below Grade • using Pump-Trap

Figure 24:

**Drainage of Condensate from BELOW GRADE for a Closed Loop System
in Situations with Minimal Fill Head
(Pump-Trap Applications)**

PMP & PUMP-TRAP APPLICATIONS

CONDENSATE DRAINAGE using Vertical Reservoir and Pump-Trap

PURPOSE:

For drainage of condensate from below process equipment where fill head is limited due to height restrictions and a horizontal reservoir cannot be installed.

OPERATION:

This system functions similarly to the system shown on page 455. However, when fill head is restricted due to heat exchanger height above ground, consider a vertical reservoir in lieu of a horizontal reservoir. This would accommodate condensate back-up as well as provide sufficient vapor space for the adequate venting of the pump while providing sufficient fill head to ensure proper operation of the pump.

INSTALLATION GUIDELINES:

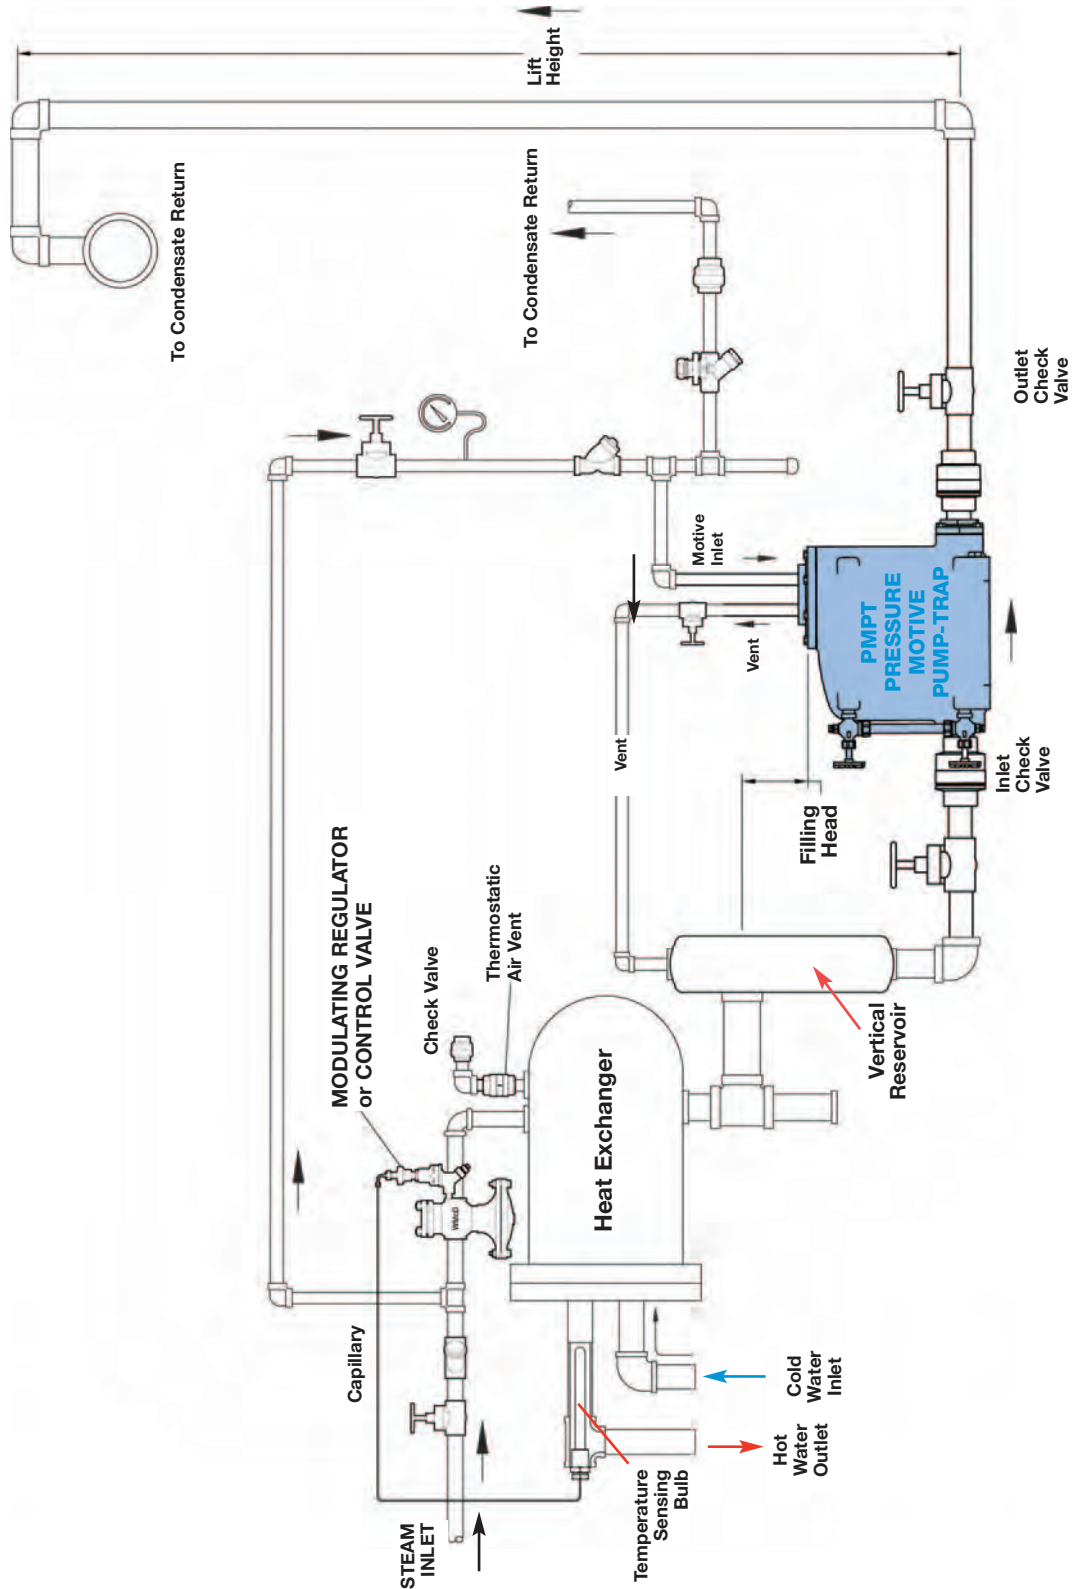

(see Figure 25)

- The vertical reservoir must be properly designed and installed to allow adequate condensate back-up during the pump's discharge cycle (i.e. when not filling), unobstructed venting of the pump, as well as sufficient fill head to ensure proper pump and system operation. Consult factory for additional assistance.
- Proper installation and piping of the pump vent line is critical to ensure the system operates correctly. Follow guidelines or consult factory for additional information.
- When using a pump-trap with integral steam trap, the trap has been sized in conjunction with the pump. If an application requires the higher capacity capability of a pump-trap with an external steam trap, the steam trap after the pump must be sized in conjunction with the pump to ensure proper function as a system. Improper sizing may potentially dangerous waterhammer. Consult appropriate sections of this catalog or the factory for guidelines regarding proper sizing of the pump-trap combination.
- Low-cracking pressure (1/4 PSI opening pressure) check valves should be installed after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system. .
- The thermostatic air vent located on the heat exchanger promotes optimum heat transfer. The air vent improves heat-up times and overall heat transfer by expelling accumulated air on start-up. When properly sized and installed, the pump-trap combination can operate in sub-atmospheric (i.e. vacuum) conditions; therefore, a vacuum breaker should not be used.

PMP & PUMP-TRAP APPLICATIONS

CONDENSATE DRAINAGE using Vertical Reservoir and Pump-Trap

Figure 25:

(Pump-Trap Applications)

PMP & PUMP-TRAP APPLICATIONS

FLASH STEAM RECOVERY

PURPOSE:

For recovering flash steam from multiple condensate sources and drainage of the condensate when the total system back pressure is greater than the total of the individual source pressures.

OPERATION:

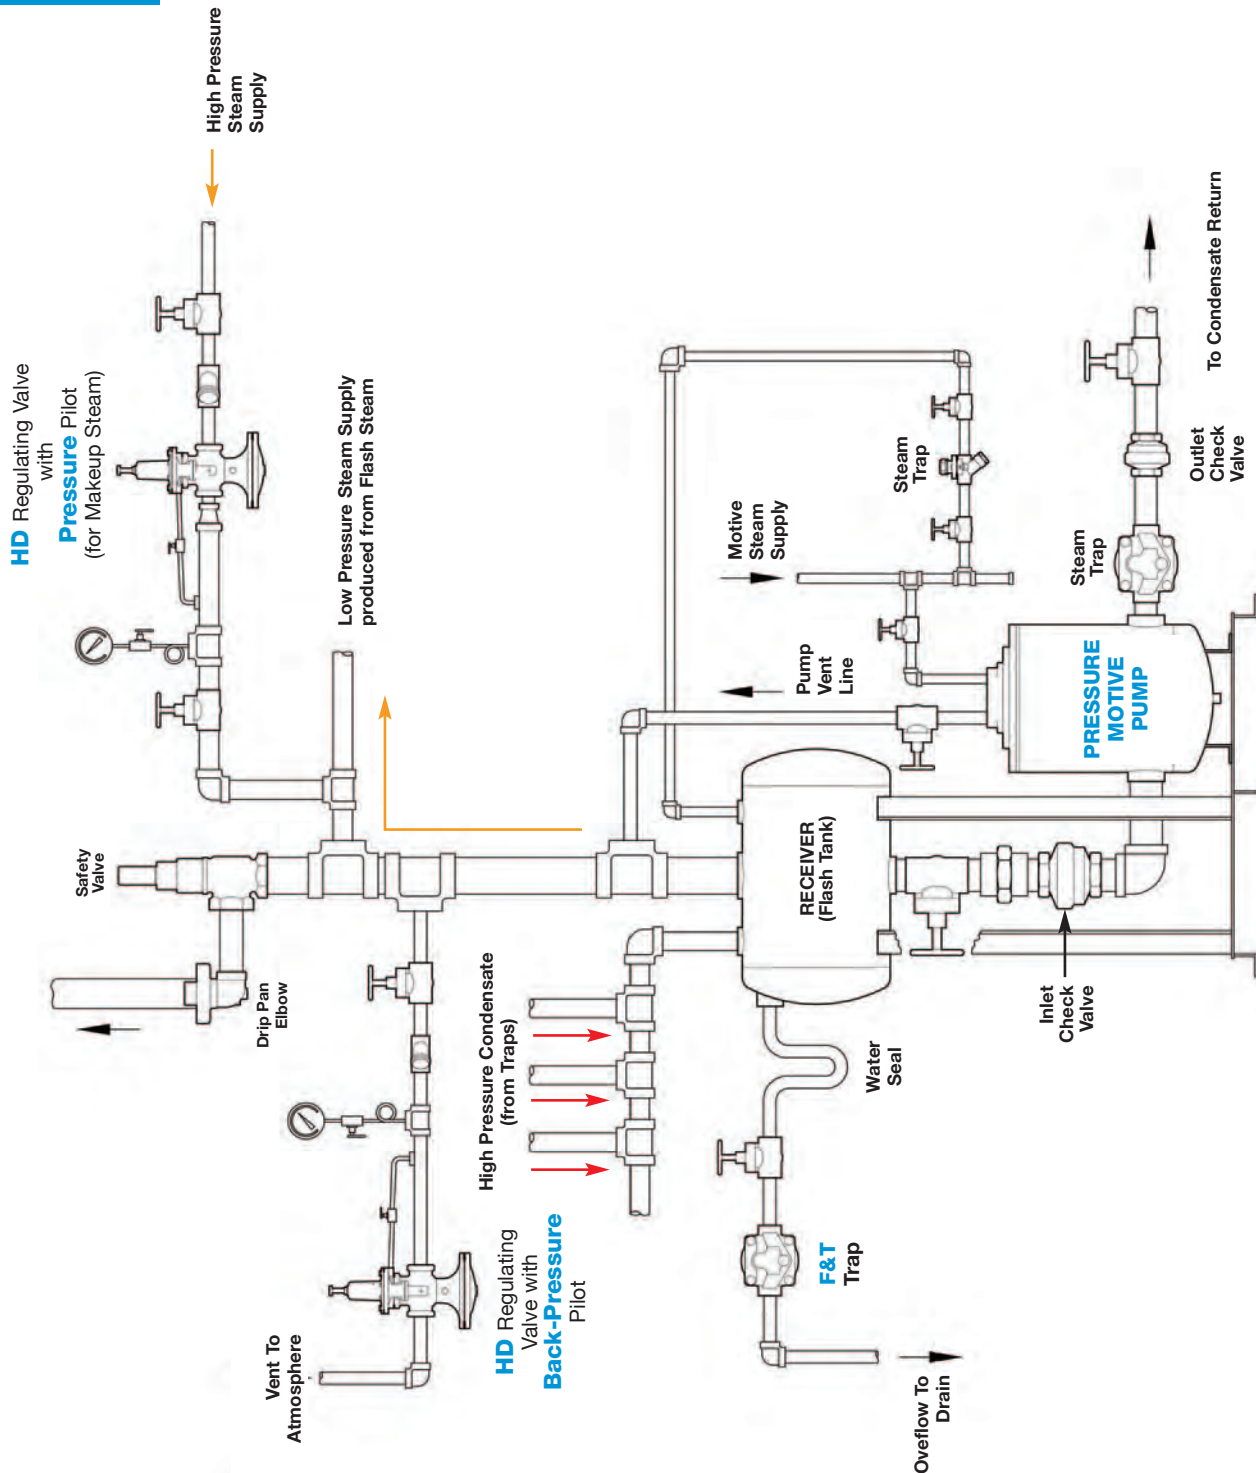

Condensate at various pressures collects in a receiver (flash tank), equalizing the pressures to that of the flash tank. This allows drainage by gravity into the Pressure Motive Pump (PMP), filling the PMP until the internal mechanism reaches its upper trip point and activates the motive steam used for pumping. The flash steam generated from the high pressure condensate may be used to supplement other applications for optimum energy efficiency. The pressure in the receiver tank is maintained by a back pressure regulator and protected by a safety relief valve.

INSTALLATION GUIDELINES:

(see Figure 26)

- The key element for proper system operation is the sizing of the receiver tank and receiver vent connection, which must accommodate the flash steam. Consult appropriate sections of this catalog or the factory for guidelines regarding proper sizing of the receiver tank and receiver vent connection.
- Proper installation and piping of the pump vent line is critical to ensure the system operates correctly. Follow guidelines or consult factory for additional information.
- Careful consideration should be given to sizing of the auxiliary components such as the back pressure regulator and safety relief valve.
- Maintain proper fill head above the top of the pump to ensure proper function of the pump and system. A suitably sized receiver or oversized piping should be installed ahead of the pump for accumulation of condensate during the pump's discharge cycle (i.e. when not filling).
- The steam trap after the pump must be sized in conjunction with the pump to ensure proper function as a system. Improper sizing may result in reduced capacity leading to condensate back-up, poor heat transfer and potentially dangerous waterhammer. Consult appropriate sections of this catalog or the factory for guidelines regarding proper sizing of the pump-trap combination.
- Low-cracking pressure (1/4 PSI opening pressure) check valves should be installed after steam traps when discharging into condensate return lines. Check valves eliminate the possibility of condensate backing up through the steam trap into the system.
- A safety relief valve (SRV) is appropriate where applicable codes dictate their requirement, or anywhere protection of downstream piping and equipment from over-pressurization is desired. Consult the factory for appropriate SRV sizing guidelines.

PMP & PUMP-TRAP APPLICATIONS

REMOVAL OF WATER OR CONDENSATE FROM A PIT

PURPOSE:

For drainage of water and condensate from collection pits – especially with minimal horizontal space.

OPERATION:

Water enters the inlet check valve through a screened area at the bottom of the PMPSP Sump Drainer. After the pump fills, the internal mechanism is actuated and the water is discharged from the pump by motive steam or compressed air or other gas.

INSTALLATION GUIDELINES:

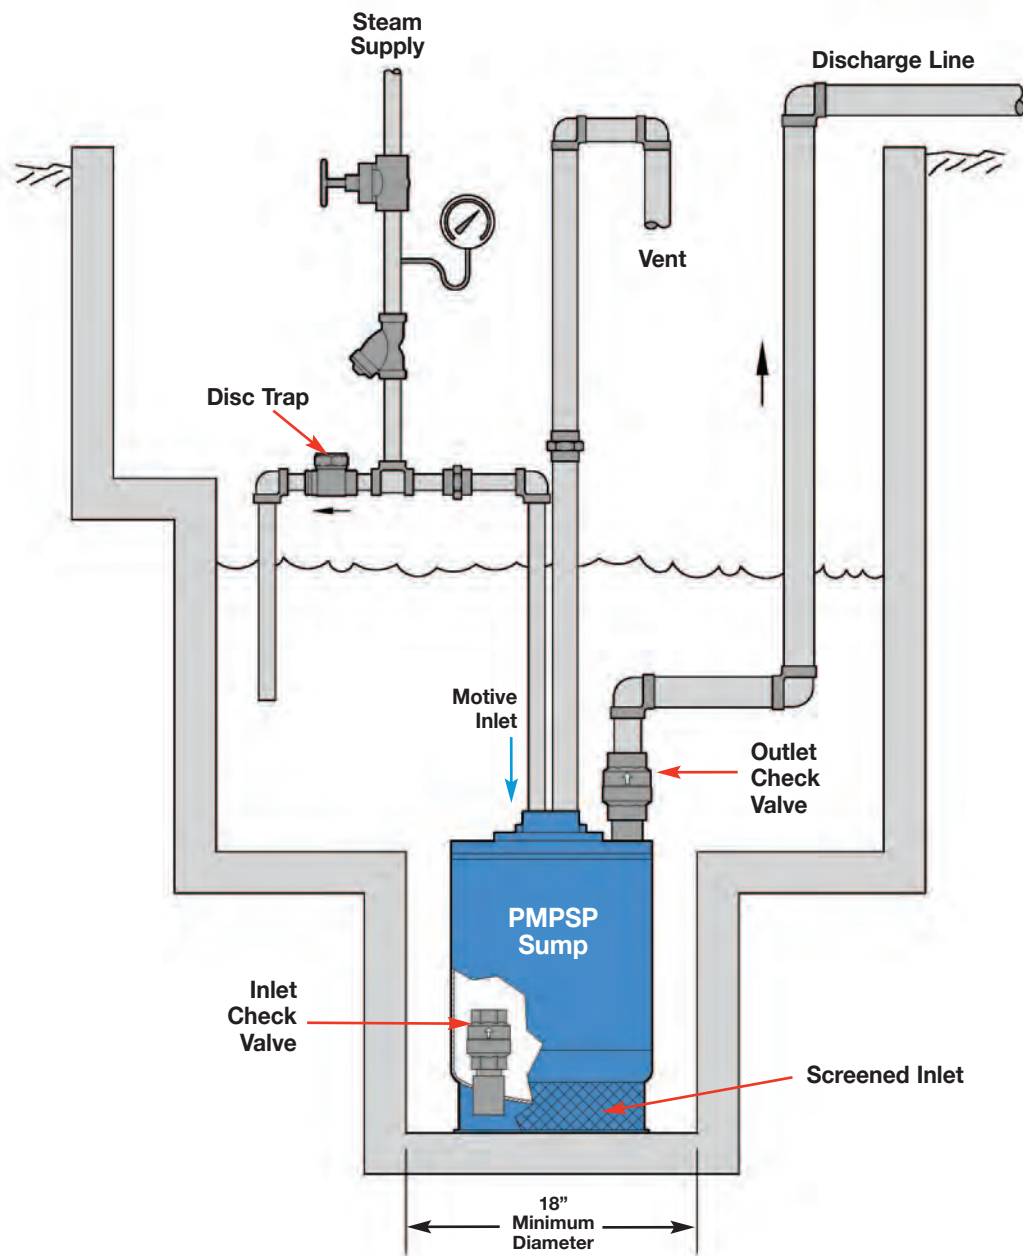

(see Figure 27)

- Make certain vent line is unobstructed and allowed to discharge directly to atmosphere.
- Other compressed gases, such as nitrogen, may be used as a motive source.
- Pit diameter should be at least 18" to ensure proper installation and operation.
- Proper installation and piping of the pump vent line is critical to ensure the system operates correctly. Follow guidelines or consult factory for additional information.
- Note that liquid level in the pit must rise above the pump to allow proper function.

HEAT EXCHANGER FORMULAS & EXAMPLE

Formulas for Heat Exchanger System using a Modulating Control Valve

Definition of Terms and Units:

E = Mean Heat Transfer Rate or Heat Load (Btu/hr)

E_D = Design Heat Load (Btu/hr)

U = Overall Heat Transfer Coefficient (Btu/(hr-ft²-°F))

A = Heat Transfer Surface Area of Heat Exchanger (ft²)

ΔT_M = Mean Temperature Difference between Steam and Water (°F)

Q_w = Volumetric Flow Rate of Water (GPM)

Q_s = Steam Load or Steam Capacity (lbs/hr)

C_p = Specific Heat Capacity of Water (Btu/(lb-°F))

T_s = Saturated Steam Temperature (°F)

T_B = Back pressure Equivalent Saturated Steam Temperature (°F)

T_o = Outlet Water Temperature (°F)

T_i = Inlet Water Temperature (°F)

ΔT_w = Temperature Rise of Water (°F) = **T_o** - **T_i**

T_{WM} = Mean Water Temperature (°F) = (**T_o** + **T_i**)/2

LH = Latent Heat of Saturated Steam (Btu/lb)

P₁ = Control Valve Inlet Pressure (PSIA)

P₂ = Control Valve Outlet Pressure (PSIA)

ΔP = Control Valve Differential Pressure (PSI) = **P₁** - **P₂**

C_v = Control Valve Flow Coefficient

Formula 1: Mean Heat Transfer Rate (E) of Heat Exchanger

$$E = U A \Delta T_M$$

The Heat Transfer Rate **E** (in Btu/hr) that takes place in a Heat Exchanger (HX) is a function of the Surface Area **A** (ft²), the average temperature difference **ΔT_M** (°F) between the steam and water, and the overall heat transfer coefficient **U**. The above formula can be used to calculate the heat loads for a HX based on the steam temperature inside the HX shell. This formula, when solved for **A**, can be used to size the HX (see **Formula 2**). Typical **U** values used for a steam to water HX range from 120 for stainless steel to over 200 for copper.

Formula 2: Heat Transfer Surface Area (A) of Heat Exchanger

$$A = \frac{E_D}{U \Delta T_M}$$

This formula is used to calculate the surface area (size) of the heat exchanger's internal tube or plates based on the design (maximum) heat load (**E_D**) and average temperature difference (**ΔT_M**) between the steam and water. Since **ΔT_M** is directly proportional to the steam pressure inside the HX shell, the specific steam pressure used to heat the water at **E_D** will determine the HX size. From the above formula, it can be seen that **ΔT_M** is inversely proportional to **A** (the surface area). Therefore, the higher the steam pressure, the smaller the HX size, and vice versa.

Formula 3: Mean Temperature Difference (ΔT_M) between Steam and Water

$$\Delta T_M = \frac{(T_s - T_o) + (T_s - T_i)}{2}$$

This formula gives the average of the temperature differences between the steam and water at the outlet of the HX (**T_s** - **T_o**) and at the inlet of the HX (**T_s** - **T_i**).

Formula 4: Saturated Steam Temperature (T_s) as function of Mean Temperature Difference

$$T_s = \Delta T_M + T_{WM} \quad \text{Where, } T_{WM} = (T_o + T_i)/2$$

This formula is derived by solving **Formula 3** for **T_s**. It is useful for determining the steam temperature when the mean temperature difference (**ΔT_M**) is known. For example, the steam temperature at minimum load can be determined by solving **Formula 1** for **ΔT_M** when **E** = **E_{min}**, and then substituting **ΔT_M** into the above formula. Once **T_s** is known, the pressure inside the HX shell can be determined from the Saturated Steam Table.

Formula 5: Heat Load (E)

$$E = Q_w \times 500 \times C_p \times \Delta T_w = Q_w \times 500 \times (T_o - T_i) \quad [C_p = 1.0 \text{ Btu/(lb-°F)}]$$

The above formula shows that the heat load for the HX depends on the water flow rate (**Q_w**) and the water temperature rise (**ΔT_w** = **T_o** - **T_i**).

HEAT EXCHANGER FORMULAS & EXAMPLE

Formulas for Heat Exchanger System using a Modulating Control Valve

Formula 6: Steam Load (Q_s) as function of Heat Load

$$Q_s = \frac{E}{LH}$$

The steam load or capacity (Q_s in lbs/hr) is dependent on the heat load (E in Btu/hr) and the latent heat (LH in Btu/lb) the steam contains. The Latent Heat of saturated steam is dependent on the steam pressure. Consult the Saturated Steam Table in Engineering Section. LH is typically approximated to 1,000 Btu/lb.

Formula 7: Steam Load (Q_s) as function of Water Flow Rate

$$Q_s = \frac{Q_w \times 500 \times (T_o - T_i)}{LH} \quad Q_s = \frac{Q_w \times \Delta T_w}{2} \quad (\text{approximation for } LH = 1,000 \text{ Btu/lb})$$

This formula is derived by substituting the right side of **Formula 5** for E in **Formula 6**. It can be used for calculating the steam load directly from the flow rate of water to be heated.

Formula 8: Water Flow Rate (Q_w) as function of Heat Load

$$Q_w = \frac{E}{500 \times (T_o - T_i)}$$

This formula is derived by solving **Formula 5** for Q_w . It is useful for determining the water flow rate thru the HX at the stall point ($Q_{w\text{-stall}}$). This is explained in the following HX example (see part M).

Formula 9: Percent Stall Load

$$\% \text{ Stall Load} = \frac{T_B - T_{WM}}{T_S - T_{WM}} \times 100 \quad \text{Where } T_{WM} = \frac{T_o + T_i}{2}$$

This formula is used to calculate the percentage of Full Heat Load (E_D) at which heat exchanger stall will occur. Since water flow rate is proportional to heat load (see **Formula 8**), the % Stall Load can be used to calculate the water flow rate at stall (see **Formula 10**).

Formula 10: Water Flow Rate at Stall ($Q_{w\text{-stall}}$)

$$Q_{w\text{-stall}} = Q_{w\text{-full load}} \times (\% \text{ Stall Load})/100$$

Where, $Q_{w\text{-full load}}$ = Water flow rate at design (maximum) heat load (E_D) = Maximum water flow rate

This formula is used in conjunction with **Formula 9** to calculate the water flow rate at which heat exchanger stall will occur without having to know the size of the HX.

Formula 11: Control Valve Steam Capacity (Q_s) at Sub-Critical Flow

$$\text{For } \Delta P < 0.42 P_1: \quad 11a: Q_s = 2.1 C_v \sqrt{\Delta P (P_1 + P_2)} \quad 11b: C_v = \frac{Q_s}{2.1 \sqrt{\Delta P (P_1 + P_2)}}$$

These formulas are applied when the pressure drop across the control valve (ΔP) is less than the critical pressure drop ($0.42 P_1$).

Formula 12: Control Valve Steam Capacity (Q_s) at Critical Flow

$$\text{For } \Delta P \geq 0.42 P_1: \quad 12a: Q_s = 1.71 C_v P_1 \quad 12b: C_v = \frac{Q_s}{1.71 P_1}$$

When the pressure drop across the valve (ΔP) is greater than or equal to the critical pressure drop ($0.42 P_1$), the steam capacity (Q_s) depends only on the valve inlet pressure (P_1). The flow rate at this condition is called the critical flow. For a constant inlet pressure, the critical flow is the maximum capacity of the valve. The above formulas are derived from **Formula 11a** by using the critical pressure drop ($\Delta P = 0.42 P_1$) and differential pressure ($\Delta P = P_1 - P_2$) formulas to eliminate ΔP and P_2 from the equation.

Note: Formulas 11 and 12 are simplified versions of the steam flow equation.

HEAT EXCHANGER FORMULAS & EXAMPLE

Heat Exchanger Example:

Heating Water with Steam using a Modulating Control Valve

Basic overview of system:

A shell and tube heat exchanger (HX) is used to heat 100 GPM of water from 50°F to 140°F using saturated steam at 100 PSIG to the inlet side of the control valve. A modulating control valve, in conjunction with a temperature sensor and electronic controller, is used to regulate the flow of steam into the HX. At the design load of 100 GPM, the valve will supply the HX with 50 PSIG steam. At times of lower demand, the flow rate of water can be reduced to a minimum of 25 GPM. The HX is constructed with stainless steel and has an overall heat transfer coefficient of 120 Btu/(hr-ft²-°F). The condensate produced from the condensing steam in the HX will drain thru a float-type steam trap located directly below the exchanger outlet and into a condensate return line with total back pressure of 10 PSIG.

OBJECTIVES: (see Figure 18)

- 1) Select an appropriately sized **HX** that will effectively heat water from an estimated start temperature of 50°F to a final temperature of 140°F. The system must operate effectively in the flow rate range of 25 GPM to 100 GPM.
- 2) Select the appropriately sized **Control Valve** to effectively deliver steam to the HX.
- 3) Select the appropriately sized **Steam Trap** for draining condensate from the HX. The selection is based on steam pressure and condensate load in the HX.
- 4) Discuss advantages of using a **Pumping Trap** so the steam system can operate in vacuum during low demand, why a pumping trap may be a necessity if the condensate return line has back pressure or the condensate must be lifted after the HX, and how to select the proper size Pumping Trap.

Figure 18: Heat Exchanger System with Steam Trap at Maximum Load

HEAT EXCHANGER SIZING

The basic formula describing the heat transfer in a heat exchanger is $E = U \times A \times \Delta T_M$, where E (Btu/hr) is the average heat transfer rate, U is the overall heat transfer coefficient, A (ft²) is the heat transfer surface area (size) of the HX and ΔT_M is the average temperature difference between the steam and water being heated.

A) What is the design heat load (E_D) for this application?

The first step in sizing a HX is to calculate the maximum heat load (Btu/hr) required to heat the water. The design heat load (E_D) of the heat exchanger is the maximum heat load that needs to be transferred by the steam to the water based on the given conditions. The maximum heat load occurs at the maximum water flow, which is 100 GPM. Using **Formula 5**:

$$E_D = Q_w \times 500 \times C_p \times \Delta T_w$$

$$= 100 \text{ GPM} \times \frac{500 \text{ lbs/hr}}{1 \text{ GPM}} \times 1.0 \text{ Btu/(lb-°F)} \times (140^\circ\text{F} - 50^\circ\text{F})$$

$$= 50,000 \text{ lbs/hr} \times 1.0 \text{ Btu/(lb-°F)} \times 90^\circ\text{F}$$

$$= 4,500,000 \text{ Btu/hr}$$

HEAT EXCHANGER FORMULAS & EXAMPLE

Heat Exchanger Example:

Heating Water with Steam using a Modulating Control Valve

B) What is the mean temperature difference (ΔT_M) between the steam and the water being heated?

From the HX formula we can see that in order to determine the size of the HX required to heat the water, we must first know the steam temperature (which is directly related to steam pressure) in the HX during the period of maximum demand. The steam pressure in the HX is dependent on the pressure drop across the control valve.

For optimal control in heating applications, it is typical to target a 50% pressure drop across the valve at the maximum steam load. Therefore, at full load, the pressure drop across the control valve is 50 PSIG and the steam pressure supplied to the heat exchanger is also 50 PSIG.

As the steam (primary fluid) passes thru the heat exchanger, it transfers its latent heat energy to the water (secondary fluid) and condenses without a change in temperature. Therefore, the condensate leaving the heat exchanger is at the same temperature as the steam entering. From the saturated steam table, the steam temperature (T_s) of 50 PSIG saturated steam is 298°F. The water inlet temperature (T_i) is 50°F and the water outlet temperature (T_o) is 140°F.

We now have enough information to calculate the mean temperature difference between the steam (primary fluid) and water (secondary fluid). **Formula 3** is used to calculate the mean temperature difference (ΔT_M) which is the average of the temperature differences at both ends of the HX:

$$\Delta T_M = \frac{(T_s - T_o) + (T_s - T_i)}{2} = \frac{(298 - 140) + (298 - 50)}{2} = \frac{158 + 248}{2} = \frac{406}{2} = 203^\circ\text{F}$$

C) What is the Overall heat transfer coefficient (U) of the heat exchanger?

The U value of the HX depends on several factors, including type of HX, the quality of the steam used, if any fouling is expected, if the flow of water is turbulent or laminar, and the material of construction. The higher the U value, the better the heat transfer, and the smaller the HX needs to be. Typical U values range from 120 for a stainless steel HX to over 200 for copper. For this example, a Stainless Steel HX was selected for longevity purposes and so a U value of 120 will be used to determine the HX size.

D) What is the minimum heat transfer surface area (A) of the heat exchanger that can meet the design heat load?

The size of a HX is dependent on the steam pressure inside its shell. The higher the steam pressure, the smaller the HX for a given heat load. 50 PSIG was chosen because the supply pressure is 100 PSIG and this gives a 50% pressure drop across the control valve, as previously discussed. If a lower steam pressure is used, this would require a larger HX, and vice versa.

In a heat exchanger, the mean heat transfer rate is proportional to the mean temperature difference between the two fluids, as given by **Formula 1**. Rearranging this equation gives **Formula 2**, where **E** has been replaced by **E_D**, the design heat load. Using **Formula 2** and the mean temperature difference determined above, gives the heat transfer surface area:

$$A = \frac{E_D}{U \Delta T_M} = \frac{4,500,000 \text{ Btu/hr}}{120 \text{ Btu/(hr-ft}^2\text{-}^\circ\text{F)} \times 203^\circ\text{F}} = 185 \text{ ft}^2$$

Therefore, for a perfectly sized heat exchanger, the heat transfer area of the tube is 185 square feet. In practice, the heat exchanger is usually oversized by at least 15% to account for fouling of the heating surfaces over time or to allow for an increase in the maximum heat load.

HEAT EXCHANGER FORMULAS & EXAMPLE

Heat Exchanger Example:

Heating Water with Steam using a Modulating Control Valve

CONTROL VALVE SIZING

E) What is the flow of steam (steam capacity) thru the control valve at the design heat load?

Formula 6 gives the mass flow rate of steam based on the heat load and the latent heat of saturated steam (LH). From the saturated steam table, the latent heat of 50 PSIG steam is 912 Btu/lb. Therefore, the steam capacity is:

$$Q_s = E_D / LH = 4,500,000 \text{ Btu/hr} / 912 \text{ Btu/lb} = \mathbf{4,934 \text{ lbs/hr}}$$

F) How must the control valve be sized?

The valve must be sized for the maximum steam capacity of the application, which occurs at the maximum (design) heat load of the heat exchanger. We first need to determine if the pressure drop across the valve at the maximum flow rate is above or below the critical pressure drop, so that we can apply the correct formula:

$$\text{Valve Inlet Pressure (P}_1\text{)} = \text{Steam Supply Pressure} = 100 \text{ PSIG} + 14.7 = \mathbf{114.7 \text{ PSIA}}$$

$$\text{Valve Outlet Pressure (P}_2\text{)} = \text{Heat Exchanger Pressure} = 50 \text{ PSIG} + 14.7 = \mathbf{64.7 \text{ PSIA}}$$

$$\text{Differential Pressure (\Delta P)} = P_1 - P_2 = 114.7 - 64.7 = \mathbf{50 \text{ PSI}}$$

$$\text{Critical Pressure Drop (\Delta P}_{\text{critical}}\text{)} = 0.42 P_1 = 0.42 (114.7) = \mathbf{48.2 \text{ PSI}}$$

Since the pressure drop across the valve (50 PSI) is greater than the critical pressure drop (48.2 PSI), the steam flow thru the valve is critical. Therefore, we apply **Formula 12b** to calculate the valve coefficient:

$$C_v = Q_s / (1.71 \times P_1) = 4,934 / (1.71 \times 114.7) = 4,934 / 196.1 = 25.2$$

Therefore, the control valve must have a flow coefficient of at least 26.

G) What Watson-McDaniel Control Valve should be selected for this application?

Refer to the Control Valves section of this catalog. The Watson McDaniel **HB-Series 2-Way Pneumatic Control Valve** is used for heating and cooling applications. Since this is a heating application with steam, a Normally-Closed, Air-To-Open (ATO) valve should be selected. (This is a fail-safe feature in case the air signal to the valve actuator becomes interrupted. If the air signal is lost, the valve will automatically close and block the flow of steam.)

Referring to the HB Control Valve Selection chart, a full-port valve with Cv value of 42 should be selected. The Model Number for this valve with NPT ports is **HB-17-N-ATO**. This valve has a 2" NPT connection size, stainless steel body and trim, and a pressure-temperature rating of 300 PSIG @ 450°F.

HEAT EXCHANGER FORMULAS & EXAMPLE

Heat Exchanger Example:

Heating Water with Steam using a Modulating Control Valve

H) What is the maximum close-off pressure of the control valve selected in Part G?

From the HB Control Valve Selection chart, the maximum close-off pressure for the selected valve is 85 PSI ΔP if no positioner is used, and 135 PSI ΔP if a positioner is used.

I) For the selected control valve, is a positioner required to completely shut off the flow of steam to the heat exchanger?

When the control valve is completely closed, the pressure drop across the valve is at its maximum value:

$$\begin{aligned}\Delta P_{\text{MAX}} &= \text{Steam Supply Pressure} - \text{Heat Exchanger Pressure} \\ &= 100 \text{ PSIG} - 0 \text{ PSIG} \\ &= 100 \text{ PSI}\end{aligned}$$

Thus, the control valve must have a close-off pressure capability of at least 100 PSI. Without a positioner, the maximum close-off pressure of the valve is 85 PSI. Therefore, a valve positioner is necessary to provide the required closing force to the actuator diaphragm.

In a normally-closed valve, the valve is held closed by a spring force. The spring pressure is set so that the valve will stay closed against an inlet pressure of 85 PSIG. The opening action is performed by the 3-15 PSIG air signal to the actuator diaphragm. When the air signal is 15 PSIG, the valve will completely open against the spring pressure. When the air signal is 3 PSIG, the valve will stay closed provided that the inlet pressure does not exceed 85 PSIG. If the inlet pressure exceeds 85 PSIG, the valve will open and a positioner will then be required to decrease the air signal pressure below 3 PSIG to allow the valve to fully close.

HEAT EXCHANGER FORMULAS & EXAMPLE

Heat Exchanger Example:

Heating Water with Steam using a Modulating Control Valve

STEAM TRAP SIZING

J) What type and size of steam trap should be chosen for this application?

Initially we will assume that the condensate from the HX is being discharged to a condensate return line at atmospheric pressure (0 PSIG). At full-load, the steam pressure at the inlet of the trap is 50 PSIG. We have already calculated the maximum condensate load that would be generated at this pressure to be around 5,000 lbs/hr (see Part E). If this was the only set of conditions, selection of the steam trap would be fairly simple. We simply look at the capacity chart and choose a steam trap that will pass at least 5,000 lbs/hr at 50 PSI differential pressure. (See the capacity chart below for the FTE Series Float & Thermostatic steam traps.)

However, at different flow rates of water, the HX will have very different pressures. At a flow rate of ~58 GPM, the pressure in the HX drops to 0 PSIG and the HX is still producing condensate at the rate of ~2,700 lbs/hr. This condensate still needs to be drained from the HX but how can this happen with NO differential pressure? The purpose of having an extended drip leg under the HX is to give the trap a certain amount of head pressure. If the trap is mounted 14 inches below the HX, this will correspond to ½ PSI of head pressure. The trap must then be able to pass at least 2,700 lbs/hr of condensate at ½ PSI ΔP.

CAPACITIES — Condensate (lbs/hr)

Model Code	PMO (PSIG)	Pipe Size	Orifice Size	Differential Pressure (PSI)

* Single seat orifice. All others are double seated.

As a general rule, for HX applications using steam pressures over 30 PSIG, the steam trap should be sized for 2.5X maximum condensate load at full differential pressure. Therefore, to provide an appropriate safety margin, we must select a trap that can pass $2.5 \times 5,000 = 12,500$ lbs/hr of condensate at 50 PSI ΔP. In addition, the steam trap must be able to handle the maximum possible inlet pressure which is 100 PSIG (the steam supply pressure). Referring to the FTE capacity chart above; the best trap to select is the **FTE-200-17-N**. This trap can pass 19,000 lbs/hr at 50 PSI ΔP and 4,100 lbs/hr at ½ PSI ΔP, which meets the above criteria.

HEAT EXCHANGER FORMULAS & EXAMPLE

Heat Exchanger Example:

Heating Water with Steam using a Modulating Control Valve

Now, what happens when the water flow rate thru the HX reduces to the point that the steam pressure goes into vacuum? This occurs at water flow rates below about 58 GPM down to the minimum of 25 GPM. Since the HX will be operating in vacuum, the condensate would not effectively drain regardless of the steam trap size chosen. This is why a vacuum breaker must be added to the top of the HX. The vacuum breaker draws in air to neutralize the pressure in the HX which allows the condensate to drain (see Figure 19).

Figure 19: Heat Exchanger System with Steam Trap shown with and without Vacuum Breaker

The HX can be properly drained using a steam trap as long as there is no BACK PRESSURE in the condensate return line. If there is back pressure in the condensate return line, a Pumping Trap must be used.

HEAT EXCHANGER FORMULAS & EXAMPLE

Heat Exchanger Example:

Heating Water with Steam using a Modulating Control Valve

PUMP-TRAP SIZING

K) If the condensate return line has a total back pressure of 10 PSIG, can a steam trap be used to drain the heat exchanger?

At full-load conditions, the steam pressure is 50 PSIG and the condensate load is ~5,000 lbs/hr. Since the total back pressure of the return line is 10 PSIG, the differential pressure across the steam trap is 40 PSI. An appropriately sized steam trap can handle this situation. However, when the steam pressure is reduced to 10 PSIG or lower, due to lower heat demand, the differential pressure across the steam trap will be 0 PSIG or less. Without positive differential pressure across the trap, the condensate cannot drain from the HX. During this situation, the condensate will back up into the HX shell. Therefore, a steam trap will not be effective in discharging condensate from the HX under **all** conditions.

L) If the water flow rate is reduced, less heat energy per unit of time is needed to heat the water and therefore the heat load will also reduce. This will cause a reduction in steam flow and pressure in the heat exchanger. If the steam pressure falls to or below the system back pressure, the condensate will begin to back up into the heat exchanger, causing the system to stall. Why is it important to prevent stall from occurring?

Condensate flooding the heat exchanger space will cause poor temperature control, accelerated corrosion and potentially damaging waterhammer. These factors can cause rapid or premature failure of the unit, leading to costly repairs and downtime.

M) For the heat exchanger size (surface area) calculated in Part D, what is the flow rate of water at which stall will occur?

We will use two methods to calculate the water flow rate at stall and then compare the two methods.

Method 1: Based on Heat Exchanger Size

Stall occurs at the point where the steam pressure equals the back pressure. The steam pressure at stall is therefore 10 PSIG. From the saturated steam table, this is equivalent to a steam temperature (**T_s**) of 239°F. **Formula 3** can now be used to calculate the mean temperature difference between the steam and water:

$$\Delta T_M = \frac{(T_s - T_o) + (T_s - T_i)}{2} = \frac{(239 - 140) + (239 - 50)}{2} = \frac{99 + 189}{2} = \frac{288}{2} = 144^\circ\text{F}$$

The heat load at stall is then calculated from **Formula 1**:

$$E_{\text{stall}} = U A \Delta T_M = 120 \text{ Btu}/(\text{hr}\cdot\text{ft}^2\cdot^\circ\text{F}) \times 185 \text{ ft}^2 \times 144^\circ\text{F} = 3,196,800 \text{ Btu/hr}$$

Finally, the volumetric flow rate of water at stall is calculated from **Formula 8**:

$$\begin{aligned} Q_{w\text{-stall}} &= E_{\text{stall}} / [500 \times (T_o - T_i)] \\ &= \frac{3,196,800}{[500 \times (140 - 50)]} = \frac{3,196,800}{(500 \times 90)} = \frac{3,196,800}{45,000} \\ &= 71 \text{ GPM} \end{aligned}$$

Method 2: Based on % Stall Load Formula

T_s = Steam temperature at full-load = 298°F (50 PSIG steam)

T_B = Back pressure equivalent saturated steam temperature = 239°F (10 PSIG steam)

$$T_{WM} = \text{Mean water temperature} = \frac{T_o + T_i}{2} = \frac{140 + 50}{2} = 95^\circ\text{F}$$

Using **Formula 9**:

$$\% \text{ Stall Load} = \frac{T_B - T_{WM}}{T_s - T_{WM}} \times 100 = \frac{239 - 95}{298 - 95} \times 100 = .71 \times 100 = 71\%$$

The water flow rate at stall is then calculated using **Formula 10**:

$$Q_{\text{stall}} = Q_{w\text{-full load}} \times (\% \text{ Stall Load})/100 = 100 \text{ GPM} \times 71/100 = 71 \text{ GPM}$$

HEAT EXCHANGER FORMULAS & EXAMPLE

Heat Exchanger Example:

Heating Water with Steam using a Modulating Control Valve

Comparison of Methods:

Both methods gave the same result for the water flow rate at which stall will occur: 71 GPM. This means that at flows at or below 71 GPM, the steam pressure in the system is insufficient to push the condensate thru the steam trap and into the return line. The condensate will therefore back up into the heat exchanger unless something is done to prevent it.

The main difference between the two methods is that the heat exchanger size was needed to calculate the stall flow rate using **Method 1**, but not needed using **Method 2**.

N) How can stall (condensate back-up) be prevented?

Stall can be prevented by replacing the steam trap with a pump-trap (i.e., a pressure motive pump and steam trap combination). Pump-traps are available with either internal or external steam traps, depending on capacity requirements.

When there is sufficient steam pressure to push the condensate thru the trap, the pump is not used and the pump-trap is operating in **trap mode**. The condensate will pass thru the pump body and thru the trap. The trap must be sized to handle the condensate at full-load conditions as well as when the trap differential pressure is slightly above 0 PSI (i.e., just above the stall point). In addition, the orifice size of the trap should be optimized to handle the high instantaneous discharge flow rate when the pump is operating. This will reduce the discharge time of the pump and its overall fill/discharge cycle. Watson McDaniel pump-traps have the trap size optimized for all conditions.

When the steam pressure drops to or below the back pressure, the condensate will start to fill the pump tank. When the float in the tank reaches the upper trip point, the mechanism will open the steam valve while simultaneously closing the vent valve. High pressure steam will then force the condensate thru the trap and into the condensate return line. Check valves are used with the pump to prevent the backflow of condensate. When the pump is emptied, the float mechanism will then simultaneously close the steam valve and open the vent valve so the pump can fill on the next cycle. When the pump is being used, the pump-trap is operating in **pump mode**. The pump must be sized to handle the condensate load at the stall point. That is, when the steam pressure is equal to the back pressure.

When sizing Pressure Motive Pumps in closed-loop return systems, a condensate **reservoir** should be installed on the inlet side of the pump and below the HX, as shown in Figure 20. This will enable the condensate to collect while the pump is in the discharge cycle, thus preventing liquid backup into the HX. The reservoir should be located 12" above the top of the pump tank to provide adequate filling head. The reservoir must have sufficient size (volume) to provide adequate vapor space for the condensate to collect during the pump's discharge cycle and for the pump to vent during its filling cycle. The vent line also acts as a balancing line to allow condensate to drain into the pump tank while the HX is operating in vacuum.

Figure 20: Heat Exchanger System with Pump-Trap at Stall Load

HEAT EXCHANGER FORMULAS & EXAMPLE

Heat Exchanger Example:

Heating Water with Steam using a Modulating Control Valve

O) If a pump-trap is used to prevent stall, what capacity must the pump have?

The maximum condensate load that the pump must discharge occurs at the stall point (i.e., when the steam pressure is equal to the total back pressure of the condensate return line). This can be determined from the steam load at the stall point, using **Formula 6**. The heat load at stall was determined in Part M to be 3,196,800 Btu/hr. The steam temperature at stall was also determined in Part M to be 239°F. From the steam table, the latent heat of steam at 239°F is 953 Btu/lb. The steam capacity is:

$$Q_s = E_{\text{stall}} / LH = 3,196,800 \text{ Btu/hr} / 953 \text{ Btu/lb} = \mathbf{3,354 \text{ lbs/hr}}$$

The maximum condensate load at stall conditions is therefore 3,354 lbs/hr and the pump must be sized to remove condensate at this rate.

P) What Watson-McDaniel Pump-Trap should be selected for this application?

Referring to the pump-trap capacity chart when operating in **Pump Mode**, it can be seen that model **WPT3** (pump with external trap mounted on common base) can meet the condensate load at stall (3,354 lbs/hr) when the motive steam pressure is 50 PSIG and the total back pressure is 10 PSIG. Under these conditions, this model has a maximum capacity of 4,080 lbs/hr. Since the steam supply pressure is 100 PSIG, a pressure regulator can be used to reduce the pressure to 50 PSIG for the motive steam line.

MINIMUM LOAD & OPERATION IN VACUUM

Q) What is the minimum heat load of the application?

The minimum heat load occurs at the minimum water flow of 25 GPM. Using **Formula 5**:

$$\begin{aligned} E_{\text{min}} &= Q_w \times 500 \times C_p \times \Delta T_w \\ &= 25 \text{ GPM} \times \frac{500 \text{ lbs/hr}}{1 \text{ GPM}} \times 1.0 \text{ Btu/(lb-°F)} \times (140^\circ\text{F} - 50^\circ\text{F}) \\ &= 12,500 \text{ lbs/hr} \times 1.0 \text{ Btu/(lb-°F)} \times 90^\circ\text{F} \\ &= \mathbf{1,125,000 \text{ Btu/hr}} \end{aligned}$$

R) What is the steam temperature in the heat exchanger at the minimum load?

Use **Formula 1** to calculate the mean temperature difference between the steam and water:

$$\Delta T_M = E_{\text{min}} / (U A) = 1,125,000 \text{ Btu/hr} / (120 \text{ Btu/(hr-ft}^2\text{-°F)} \times 185 \text{ ft}^2) = 50.7^\circ\text{F}$$

The steam temperature is then given by **Formula 4**:

$$T_s = \Delta T_M + T_{WM} = \Delta T_M + \frac{T_o + T_i}{2} = 50.7 + \frac{140 + 50}{2} = 50.7 + \frac{190}{2} = 50.7 + 95 = \mathbf{146^\circ\text{F}}$$

S) What is the steam pressure in the heat exchanger at the minimum load?

From the steam table (using extrapolation), the steam pressure corresponding to 146°F saturated steam is 22.7 in Hg Vacuum which is equivalent to -11.1 PSIG. Therefore, the steam pressure inside the heat exchanger is below atmospheric pressure.

This is another advantage in the use of a pump-trap. If a steam trap is used to drain condensate, the system could not operate in vacuum since the condensate would never drain out. Therefore, a vacuum breaker is used which essentially mixes the steam with air to achieve the proper temperature differential for a particular size HX. This added air facilitates corrosion by forming carbonic acids. Some of this air is eventually discharged thru the air vent on top of the HX but some mixes with the condensate. A pump-trap can discharge condensate when the HX is operating in vacuum, which precludes the use of a vacuum breaker and thus air is prevented from entering the system.

HEAT EXCHANGER FORMULAS & EXAMPLE

Heat Exchanger Example:

Heating Water with Steam using a Modulating Control Valve

T) What is the flow of steam (steam capacity) thru the control valve at the minimum load?

From the steam table (using extrapolation), the latent heat of steam (LH) corresponding to 146°F saturated steam is 1,011 Btu/lb. Using **Formula 6**, the steam capacity is:

$$Q_s = E_{\min} / LH = 1,125,000 \text{ Btu/hr} / 1,011 \text{ Btu/lb} = 1,113 \text{ lbs/hr}$$

Figure 21: Heat Exchanger System with Pump-Trap at Minimum Load

SUMMARY of HEAT EXCHANGER SYSTEM

The following table summarizes the above results and shows how the heat load and the pressure, temperature, latent heat and flow of steam vary as a function of the water flow rate. It can be seen that the system is operating in **Trap Mode** between water flow rates of 100 and 71 GPM, and in **Pump Mode** between 71 and 25 GPM. Also, at flow rates below ~58 GPM, the steam pressure inside the HX is below atmospheric pressure (0 PSIG).

Flow Rate Water (GPM)	Heat Load (Btu/hr)	Steam Usage (lbs/hr)	Steam Pressure in HX (PSIG)	Steam Temp in HX (°F)	Latent Heat of Steam (Btu/lb)	Condensate Generated (lbs/hr)	Trap Differential Pressure (PSI)	System Condition

James Watson
Circa 1895

A brief History of Watson McDaniel

Made in the USA Since 1878

Invention of Steam Trap: According to the American Society of Mechanical Engineers (ASME), the first steam trap, a floating head design, was invented in 1835. This early steam trap separated valuable, live steam from condensate, thus reducing the danger of water hammer in building heating systems.

In **1844**, the U.S. population reached **19.6 million people**, an increase from **1840** of nearly **2.4 million people**. World population estimated at **1 billion**.

**1903 No. 15
Watson McDaniel
Steam Trap**

1878

1844

James Watson, Sr. owns a monumental iron works in Philadelphia, PA

James Watson, Jr forms partnership with an entrepreneur and inventor, John S. McDaniel, and together founded Watson and McDaniel Company to produce steam specialties such as steam traps, pressure regulators, suction tees, pump governors, etc. Incidentally, this also makes Watson and McDaniel Company one of the first manufacturers of steam traps and pressure regulating valves.

1850's thru 1870's

James Watson, Sr. started Watson & Evans Company which was a manufacturer of office and bank safes.

James Watson (Jr.) graduates from Friends School and joined his father in the safe manufacturing business.

Shortly thereafter company name is changed to J. Watson & Son, Safe Manufacturers.

1880's thru 1890's

Along with another inventor, J. Chapman, several patents were earned on many products, including float-operated steam traps, steam pressure regulators, and piping exhaust heads.

1885

Patent for Steam Pipe Mixing Tee

Manufacturing High-Quality Steam & Fluid Specialty Products for Industry

1844

Birth of Henry J. Heinz, entrepreneur and founder of the H. J. Heinz Company.

The first electrical telegram is sent by Samuel F. B. Morse from the U.S. Capitol to the B&O Railroad "outer depot" Baltimore, Maryland, saying "What hath God wrought".

Birth of Elijah McCoy, inventor of the automatic steam engine lubricator

1878

The phonograph is patented by Thomas Edison.

Birth of Carl Sandburg, Poet & Historian.

Birth of Lionel Barrymore, Actor.

1896

Henry Ford test drives his first automobile on the streets of Detroit.

1897

James Watson purchased the interest of John S. McDaniel and after becoming sole owner decided to incorporate.

1940

John D. Beck became owner when Fred L. Jahn expressed a desire to retire and the Watson McDaniel Company remained in the Beck family.

1983

Expanded the product line with Pilot-Operated Regulators and Direct-Operated in order to expand into industrial markets.

1928

As part of the company's 50th anniversary celebration, the manufacturing and sales offices are combined in a building on Noble Street in Philadelphia, PA.

1929

James Watson passes away; ownership was acquired by two loyal long-time employees, Fred L. Jahn and John D. Beck.

1967

Move to a larger and more modern facility in historical Valley Forge, PA on February 6th.

JAMES WATSON
THE FOUNDER

1878

ANNOUNCEMENT

1928

The Fiftieth Anniversary of the founding of the Company, marks also the realization of a long planned and much desired objective in our business life.

On February twenty-fifth we combine our Office and Manufacturing Plant in our own building.

Located in the center of the business district, near the approach of the Delaware River Bridge, the plant will have unrestricted parking facilities which will make it more accessible to those who wish to consult with us regarding

engineering problems; and also make it more convenient for the delivery of goods.

Appreciative of your business in the past, we will strive for its continuance.

WATSON & MCDANIEL CO.

FRED L. JAHN, Pres. JOHN D. BECK, Sec. JAMES WATSON, Treas.
NOBLE STREET, WEST OF SIXTH (CORNER OF MARSHALL)
PHILADELPHIA

A brief History of Watson McDaniel (continued)

Made in the USA Since 1878

Circa 1964 - Watson McDaniel Employees

Circa 1963 Philadelphia - Watson McDaniel Noble Street Plant

1991

Picut Industries acquired Watson McDaniel and immediately appoints Robert Hickey as General Manager... to eventually become the company's President. Over the next several decades, Mr. Hickey's knowledge and drive ushers in a new era of growth and prosperity for Watson McDaniel.

2002

HD Series Ductile Iron Pilot-Operated Regulator introduced marking significant updates and improvements to older designs.

1990's

Major product development – over 60% of the current catalog products were developed during this time period.

1995

Earned ISO 9001 Quality Certification

1999

Developed the patented Snap-Assure Pressure Motive Pump mechanism making it the most reliable and effective Non-Electric Condensate Recovery Pump available on the market.

2005

Due to continued company growth, moved to expanded facility in Pottstown, PA, allowing for additional production, fabrication, and inventory to meet customer demand.

Circa 1964 - Watson McDaniel Employees

2012

Heat Miser
Instantaneous
Water Heating
Packages
introduced.

2015

Entirely new Product Catalog and Tech Manuals are introduced, marking an extensive upgrade to product and educational materials.

2020

SteamWorx website valve sizing is introduced for comprehensive control valve and pilot-operated valve, pipe, and noise attenuation sizing.

2014

All Stainless Steel HB Series Control Valve is developed as a "clean-sheet" design with unique improvements.

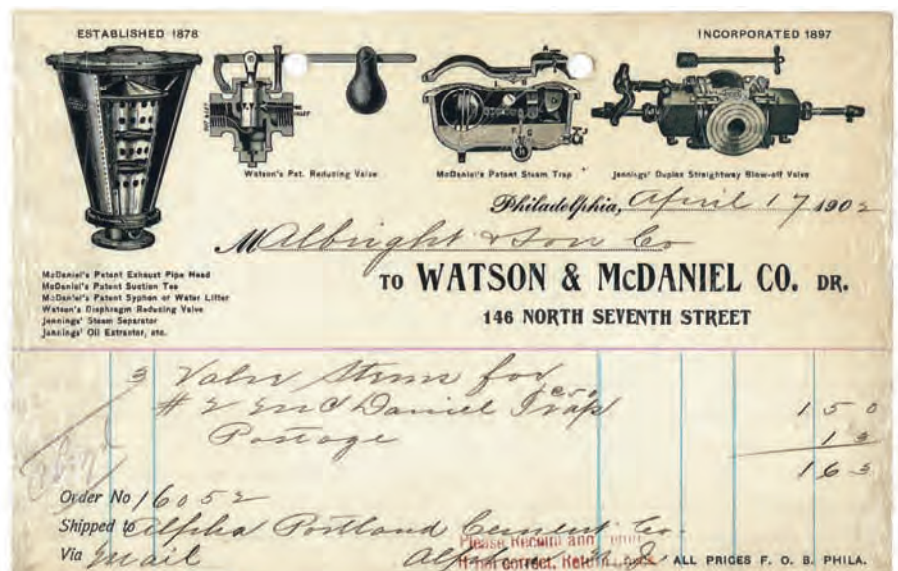

2018

The all-domestic forged carbon steel SDM Steam Distribution and CCM Condensate Collection Manifolds are introduced for heavy industrial service, continuing Watson McDaniel's long tradition of supplied USA sourced materials and finished products.

Philadelphia, Pa.

Assignment.

In consideration of one Dollar to me paid by James Watson, of Philadelphia, Pennsylvania, I, John S. McDaniel, of Wilmington, Delaware,

do hereby sell and assign to the said James Watson, an undivided one-half ($\frac{1}{2}$) of

all my right title and interest for, to and within the United States, in and to my invention of an Improved Attachment for Steam Heating Pipes, as fully set forth and described in the specification which I have prepared preparatory to obtaining Letters Patent of the United States therefor, my petition bearing even date herewith (App. filed May 24/84 - Serial No. 132,671)

And I do hereby authorize and request the Commissioner of Patents to issue said Letters Patent jointly to myself and the said James Watson, our

heirs and assigns.

Witness my hand this Nineteenth day of May 1884.

John S. McDaniel
Harry Smith

John S. McDaniel

To all to whom these presents shall come:

Whereas

John D. McDaniel
Wilmington Delaware
has presented to the Commissioner of Patents a petition praying for the grant of Letters Patent for an alleged new and useful improvement in

Horizontal Steam Pipes
Improvement in Horizontal Steam Pipes

a description of which invention is contained in the Specification of which a copy is hereto annexed and made a part hereof, and has complied with the various requirements of Law in such cases made and provided, and

Whereas upon due examination made the said Claimant is adjudged to be justly entitled to a Patent under the Law.

Now therefore these **Letters Patent** are to grant unto the said

John D. McDaniel and James Watson their heirs or assigns for the term of *ten* years from the *fourth* day of *January* *one thousand eight hundred and eighty* the exclusive right to make, use and vend the said invention throughout the United States and the Territories thereof.

In testimony whereof I have hereto set my hand and caused the seal of the Patent Office to be affixed at the City of Washington this *fourth* day of *January* our Lord one thousand eight hundred and of the Independence of the United States of America the one hundred and ninth

Countersigned.

STEAM TRAP.

APPLICATION FILED MAR. 22, 1902.

NO MODEL.

UNITED STATES PATENT OFFICE.

JOSEPH L. CHAPMAN, OF HADDONFIELD, NEW JERSEY, ASSIGNOR TO
WATSON & MCDANIEL CO., OF PHILADELPHIA, PENNSYLVANIA.

STEAM-TRAP.

SPECIFICATION forming part of Letters Patent No. 722,400, dated March 10, 1903.

Application filed March 22, 1902. Serial No. 99,415. (No model.)

To all whom it may concern:

Be it known that I, JOSEPH L. CHAPMAN, a citizen of the United States, residing at Haddonfield, in the county of Camden and State of New Jersey, have invented certain new and useful Improvements in Steam-Traps, of which the following is a specification.

My invention relates to steam-traps for the collection and discharge of condense water from steam-pipes or like apparatus, and where in the opening and closing of the discharge-valve is regulated by a float.

By the arrangement of the parts in my trap the counterweight is dispensed with and its cost saved, the ball-float in my trap being so arranged as to tend to close the valve, while the steam-pressure tends to open the valve, which is the reverse of traps with valves above the seats, where the pressure closes the valve, and a light and counter-weighted float must be used to open the valve. With my arrangement a ball of weight sufficient to overcome the steam-pressure is used. The float being of heavier material its liability to collapse is also eliminated. My valve being below the seat, any dirt or other matter which would tend to damage the valve or its seat will not lodge, but be forced away when the valve is depressed, as the water passes the valve in a hollow jet instead of in a solid column, as heretofore and with the old style of trap. The spreading of the water as it leaves the trap adds much to the trap's time of service, as the dripping is diffused and not concentrated upon a small surface, as heretofore, and which caused the trap-case to be soon eaten through and destroyed. I have also provided adjusting means for connecting the valve and the float-lever, so that my trap can be positively regulated as to the water seal, the float's position, and the accumulation of condensation therein. This adjustment also permits new valves to be substituted for worn ones without the replacing of other parts. By making the trap with an end opening to which all of the movable parts are attached and to which no pipes are attached, the valve and its seat also being in the cover, the working parts can all be removed by slackening two nuts and no pipe connections be broken, resulting in saving much time and expense.

I have also provided a simple automatic air-valve of only three parts—the seat, the valve, and nut—which can quickly be adjusted as to the amount of escape area by running the nut up or down on the stem, and all springs are done away with. The nut is guided up and down by the seat, and the air-escape is through openings formed in the nut. Where much air needs to be removed, the valve can be dropped to allow its escape, and the adjustment of the valve to a high or low position will regulate the air-escape, both as to volume and time.

My invention is illustrated in the accompanying drawings, in which—

Figure 1 is a central longitudinal section of the case, some other parts not being in section. Fig. 2 is a view at the cover end, the cover being removed. Figs. 3, 4 are views of the valve, its seat, and the adjustable connections, partly in section. Fig. 5 is a vertical section of the air-valve seat and wing-nut, the valve not being in section. Fig. 6 is a plan view of Fig. 5. Fig. 7 is a front elevation of the fulcrum-bearing.

Similar figures of reference indicate similar parts throughout the views.

The trap-case 1 is a round section at its open-ended part and at its back part has a rounded dome 2, the case being supported upon a leg 3 at the back, and upon the outlet-pipe case 4, near its front end, a cover 5 closes the open end and is held by two bolts 6, placed in open lugs 7, the cover being provided with similar lugs. Within cover 5 at its lower part is formed drain-pocket 8, which communicates with drain-pocket 9 of the case and therethrough with drain-pipe 10. The case 1 has also a blow-out pipe 11 and an inlet-pipe 12. Cover 5 has two lugs 13 projecting into the trap, and between the lugs on pin 14 is a fulcrum-bearing 15, of T-section, forming a part of the float-lever 16, the float 17 being attached to the other end of lever 16, so that the drain-valve and float move in opposite directions. The web 19 of part 15 permits the placing of pin 18 in any desired position for leverage, as it is formed to be drilled so that pin 18 may be placed in different positions through web 19 at the time of manufacture or later, to suit the pressure the

2

722,400

trap is desired to carry, as the double hubs 20 are removed from each other to clear bifurcations 21. At an angle forward of pin 14 is another pin 18, secured in web 19 of fulcrum-bearing 15 and also passing through the bifurcated connection 21 of the valve-stem 22, which is screw-threaded to connection 21 and provided with a lock-nut 23. The stem 22 has a hexagonal enlargement 24, by which it is turned to lengthen and shorten the distance between pin 18 of the fulcrum-bearing 20 and the valve 25, formed at the lower end of stem 22. The valve is coned from stem 22 downward and enters opening 26 in seat 27 and controls fluid flowing through opening 26 to drain-passage 8 in the cover 9 in the trap-case, and drain-pipe 10 secured to the case. Seat 27 is screw-threaded into part 28 of cover 5.

It will be seen that the valve, the float, and their connections are removed from the case whenever cover 5 is removed without disconnecting any pipes.

In direct line with the valve, its stem, and adjustable connection is a blow-off stem 29, screw-threaded in a stuffing-box 30, secured in lug 31 and provided with a hand-wheel 32. The stem when screwed down depresses bearing 15, lifting float 17 and opening passage 26 by moving valve 25 off its seat. At the top of dome 2 is a boss 33, into which is screwed an air-valve seat 34, having a small passage 35 through its lower part and a larger passage 36 through its upper part, the two passages being joined by a cone 37. A conical air-valve 38 seats at the lower end of passage 35 and is provided with a stem 39, upwardly tending and screw-threaded at its upper part, and thereon is a nut 40, which is adapted to be turned up and down for the adjustment of the valve close to or removed from its seat, and it is provided with wings 41, circular at their outer ends to guide it within passage 36. Between the wings are openings 42 to permit air-escape from the trap when valve 38 is not pressed to its seat by pressure within the trap.

I claim—

1. In a steam-trap, a case, an opening therefor at one end, a dome at the other end, a cover to close the opening, means to drain the trap, through its valve which is seated within the cover in a passage communicating with a passage in the trap-case, and there-through to the drain-pipe, and a float having means to control the valve against the pres-

sure within the trap, in the manner substantially as described.

2. In a steam-trap, a case, an end opening therefor, a cover for the opening, a float within the case, a coned valve, a drainage-passage in the cover and in communication with a drainage-passage in the trap-case controlled by the valve for its opening as the valve moves down, and for its closing as the valve moves up, connections from the float to the valve whereby the valve is controlled as described and the valve, the float and their connections attached to and supported by the cover in manner for their removal from within the trap whenever the cover is removed without disturbance of the drainage connections to the trap-case, substantially as set forth.

3. In a steam-trap, a case having an end opening and a cover therefor, a float fulcrumed upon the cover, a coned drain-valve in the cover and controlled by the float in manner to move the valve down to open the drain-passage, and to move the valve up to close the drain-passage, a drain-passage in the trap-case in communication with the drain-passage in the cover, and a drain-pipe attached to the case and connecting therewith, substantially as set forth.

4. As a new article of manufacture, an air-valve of cone shape, and having a threaded stem at its small end, a seat for the valve, passages through the seat of different diameters, the smaller diameter being at the valve end, a nut adapted to be adjusted, upon the stem, closely fitting within and guided by the larger-diameter passage and whereby the valve's movement is increased or decreased to facilitate or retard air escape, and passages formed in the nut for air-escape, substantially as set forth.

5. In a steam-trap a case, a valve, a float arranged to move in direction opposite to the valve, a lever for the float, a fulcrum, an extension of the lever beyond the fulcrum and to which the valve is attached, and means located upon the case, in line with the valve, operative upon the lever extension, and whereby the valve may be opened, exterior to the case, for blow-out purposes.

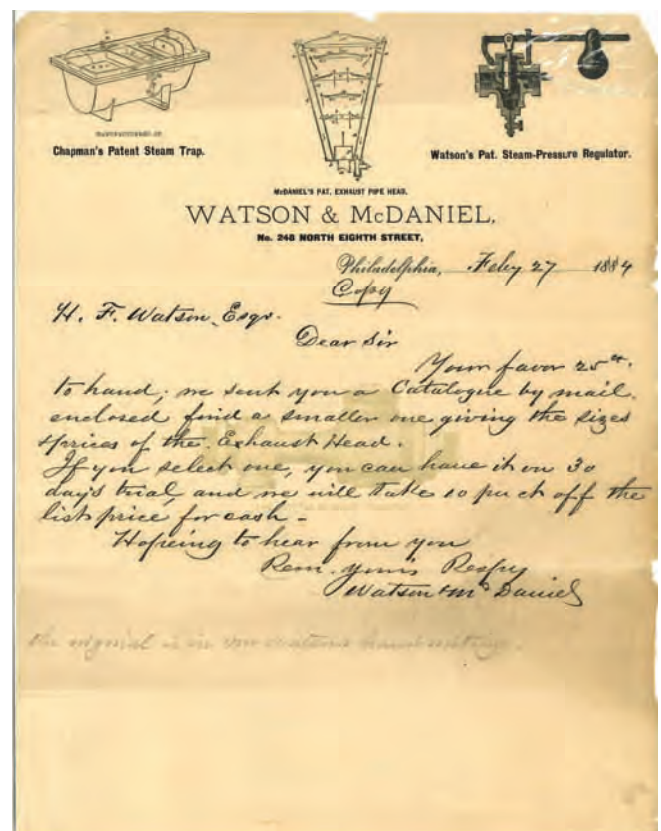

In testimony whereof I affix my signature in presence of two witnesses.

McDaniel Steam Traps

for High and Low Pressure

Nowhere in the average power plant can so great or so immediate improvement in operation be effected with so small an investment as in providing automatic, adequate steam traps. Here's where McDaniel Steam Traps are suited for.

Lowering Operating Costs

The McDaniel is a steady, constant, dependable condenser drain which keeps the lines free of water all the time, thereby insuring safety, increasing the capacity of apparatus and the working value of the steam used. This also constantly tends to

Lower Fuel Cost

Also McDaniel Traps can't blow through, leak or waste steam any more than they can let water stay in them. How much fuel are your leaky traps stealing every year? Look at the simplicity of design and the construction features shown at the right and you will see why all McDaniel Traps maintain this high record of tight, steam-saving service.

Lower First Cost

is an important item in any equipment, large or small. McDaniel Traps, with the best possible materials and workmanship and extra heavy construction are naturally not the lowest priced traps on the market. Measured by the cost per pound of water discharged you will find McDaniel Steam Traps cost far less than any ordinary traps which discharge at intervals.

This is because of their balanced valve construction permitting larger outlets.

Lower Upkeep Costs

naturally follow in this trap which is built to give better service at less cost and which is backed by a quarter of a century of specialized experience. Note the features which make McDaniel Traps enduring and trouble free. Even when attention is required, it can be given in the quickest and easiest way as shown at the right. This ease of repair and the standardization of parts make McDaniel Traps practically indestructible in service.

Try one McDaniel Trap on our action-free heating pressure to 150 lbs.—and you will quickly be convinced that it is the ONLY trap for year-to-year-out service at least cost.

Putty years' experience in the making of Steam Traps should warrant our guarantee of satisfaction.

Write for booklet today.

Here is the simple, rugged McDaniel trap which, because of its flexible passage, discharges less water than other traps. It also has an outside clamp so it is always working correctly.

McDaniel steam traps are constructed with a balanced valve seat (10) which holds the valve closed until the steam pressure is sufficient to overcome the weight of the valve. This ensures a tight seal and prevents leakage.

McDaniel steam traps are constructed with a balanced valve seat (10) which holds the valve closed until the steam pressure is sufficient to overcome the weight of the valve. This ensures a tight seal and prevents leakage.

McDaniel steam traps are constructed with a balanced valve seat (10) which holds the valve closed until the steam pressure is sufficient to overcome the weight of the valve. This ensures a tight seal and prevents leakage.
